1 INTRODUCTION

Montrose Environmental Solutions, Inc. (Montrose) has prepared this Poly-Chlorinated Biphenyl (PCB) Cleanup and Disposal Work Plan (Work Plan) in preparation for removal, management and/or disposal of PCB containing building materials and PCB impacted soil during the redevelopment of the Town of St. Johnsbury's Armory Building located at 1249 Main Street, St. Johnsbury, Vermont (Site). The proposed redevelopment will first include demolishing the majority of the rear (western) gymnasium portion of the building, gut renovation of the front (eastern) portion of the building and excavation of exterior PCB impacted soil. Following remedial activities, the Site and building will be developed into a new Town of St. Johnsbury Municipal Police and Regional Dispatch Center. This Work Plan was prepared in accordance with the U.S. Environmental Protection Agency's (EPA) Toxic Substances Control Act (TSCA) as per the United States Code of Federal Regulations 40 CFR § Part 761.61(a) "Self-implementing cleanup and disposal," and 761.61(c) "Risk-based cleanup and disposal." In 2023, Montrose and the Town have consulted and coordinated closely with the EPA regarding Site characterization, addressing data gaps and the proposed cleanup approach given the Site's proposed redevelopment and future use. Work is anticipated to commence following the effective date (February 26, 2024) for updates to TSCA's PCB Cleanup and Disposal regulations thus this Work Plan includes the updated regulations as applicable. This work will be funded by the Town of St. Johnsbury's EPA Brownfields Cleanup Grant (Cooperative Agreement No. BF-00A01034). Additional funding sources include a Brownfield Revitalization Fund Grant from the Vermont Agency of Commerce and Community Development (ACCD); a Community Development Block Grant (CDBG) from the Vermont Community Development Program (VCDP); and Revolving Loan Funds (RLF) from the Northwest Regional Planning Commission.

1.1 Site Description / Land Use

The Site consists of 0.44± acres (parcel no. 023-004-074-000) and is developed with a 2-story 16,700± square-foot (sq. ft.) masonry building constructed in 1916 as an armory. The Site has been owned by the Town of St. Johnsbury since 1975 and was used as a community recreational center until approximately 2009. The Site has been vacant since that time. The Site is bounded to the north by St. Andrews Episcopal Church; to the east by Main Street; to the south by an alley followed by a 2-story commercial building occupied by Richard Kozlowski General Dentistry; and to the west by Grace United Methodist Church.

Figure 1 depicts the general location of the Site and surrounding area on the USGS 7.5-Minute Series Topographic Series Quadrangle Map. **Figure 2** provides a Site Plan.

1.2 Purpose and Scope

The purpose of this Work Plan is to detail the means and methods of removing PCB containing building materials, removing PCB containing paint and encapsulating concrete, brick and masonry walls designated to remain, and removing PCB impacted soils. The proposed plan includes a hybrid approach of a self-implementing cleanup and disposal plan to address impacted building materials and soil, and risk-based cleanup and disposal approach to encapsulate structurally integral PCB impacted building materials that are not economically feasible to remove. This document is intended to serve as both the notification for self-implementing on-site cleanup and disposal per 40 CFR 761.61(a) and the application for risk-based disposal approval per 40 CFR 761.61(c). The Work Plan describes these approaches in **Sections 6** and **7**.

1.3 Notification/Application

This Work Plan is being provided 30 or more days in advance of cleanup activities, provides information required in 40 CFR § 761.61, and has been sent to the EPA Region 1 Administrator for approval. Per the schedule provided in **Appendix A**, construction is expected to commence on June 10, 2024. Copies of this notification/application will also be submitted to the Vermont Department of Environmental Conservation (VTDEC). A summary of the pre-characterization laboratory analytical data and proposed cleanup plan are included as part of this report. A written certification indicating that all information is available for EPA review, is attached to this report as **Section 10**.

1.4 Non-PCB Abatement and Remediation

Redevelopment of the Armory Building will require additional abatement and remediation which will be performed simultaneously with the PCB cleanup.

- Two areas of shallow impacted soils located within future greenspaces have been identified through prior investigation. One area is east of the building and is impacted with polycyclic aromatic hydrocarbons (PAHs). The second area to the south of the building and impacted with PAHs and lead. Remediation of impacted soils is subject to oversight by VTDEC.
- Abatement of asbestos will be performed in accordance with Vermont's Regulations for Asbestos Control, V.S.A. Title 18, Chapter 26 (VRAC).
- Removal of Lead-based paint (LBP) will be performed in accordance with lead safe work practices.

1.5 Document Summary

The work will be funded under the Town of St. Johnsbury EPA Brownfield Cleanup Grant and is subject to requirements of the Cooperative Agreement BF-00A01034. Additionally, as summarized in Section 1.4 various aspects of the work is subject to regulation by certain state agencies. To comply with federal and state regulations the following documents related to the redevelopment of the Site will be or have already been submitted for regulatory agency approval:

Table A – Document Summary

Plan Name	Scope	Date (actual/projected)	Approval Agency	Date Approved
Corrective Action Plan (CAP), Former St. Johnsbury Armory	Address PAH and Lead Impacted Soils	12/22/22	VTDEC	3/13/23
Addendum to the CAP	Addendum to 2022 CAP to include PCB impacted soils	February, 2024	VTDEC	TBD
Master Quality Assurance Protection Plan (QAPP) for Implementation of EPA Region 1 Brownfield Assessment and Revolving Loan Fund Grant Projects	QAPP QA Tracking No. QA#24013	November, 2023	EPA, Brownfields	December 2023
QAPP Addendum (QAPP-A)	Cleanup and Disposal of PCB Containing Building Materials, Asbestos, Lead-Based Paint, and PCB, PAH and Lead impacted soil	February, 2024	EPA, Brownfields	TBD

Plan Name	Scope	Date (actual/projected)	Approval Agency	Date Approved
Design and Specifications for Removal of Asbestos Containing Materials	Design in accordance with VRAC and included in Contract Documents	March, 2024	NA	TBD
Universal Waste Removal	Contract Documents	March, 2024	NA	TBD
Lead Paint Abatement and Substrates Removal	Contract Documents	March, 2024	NA	TBD
Building Remediation and Selective Demolition	Contract Documents	March, 2024	EPA/VTDEC	TBD

TBD- To be determined

2 SITE BACKGROUND AND HISTORY

2.1 Site History

Sanborn maps indicate that the Site contained residential dwellings between 1882 to 1912. The armory building was constructed on-Site in approximately 1916. Street Directory listings indicate continued use as an armory in some capacity from 1931 to 1974 after which the Town utilized the Site for their police and municipal departments until approximately 2009 when the building was vacated.

2.2 Geology and Hydrogeology

According to the Agency of Natural Resources (ANR) Natural Resources Atlas (NRA), native surficial soils at the Site include well sorted sand, with no pebbles or boulders. Soil boring observations generally indicate fill materials consisting of topsoil, sand, silt, and gravel of varying percentages. Native soils encountered generally consisted of well sorted fine to medium sands and were generally encountered at two feet below ground surface (ft bgs). Bedrock geology is expected to consist of phyllite from the Waits River formation. Groundwater was not previously encountered during drilling and is expected to be greater than 25 ft bgs.

2.3 Prior PCB Surveys

Numerous surveys of regulated building materials (RBMs) including asbestos, LBP and PCBs have previously been completed. Prior reports which included PCB sampling are summarized below. PCB concentrations and other historical data from these prior reports have been incorporated into **Tables 1A.1 - 1D.3** and **Figures 3A - 3D**. Prior reports are included in **Appendix B**.

2.3.1 Cardno ATC, Environmental Survey, March 28, 2013

This survey included initial inventory and sampling of building materials for asbestos and PCBs, lead paint testing, lead dust wipe sampling, mold testing (air and wipe samples), and investigation of the floor drain system. PCBs in building materials were encountered in the following materials at varying concentrations:

- Exterior Door Caulking – Gray
- Exterior Window Caulking – White
- Floor Paint – Gray
- Wall Paint – White
- Floor Paint – Blue

Concentrations ranged from 1.5 parts per million (ppm) in the white exterior window caulking to 5,700 ppm in the gray basement floor paint. Other building materials tested were non detect and therefore did not contain PCBs.

The report recommended further sampling of the basement concrete floor underlaying the PCB-containing paint to further delineate the extent of PCB impacts.

2.3.2 ATC Group Services LLC, PCB Building Material Survey, March 3, 2017

This survey included additional inventory and sampling for PCBs. Airborne PCB samples were collected from two indoor and one exterior area. Sample results for the armory building exhibited that the indoor airborne concentrations for all samples were below the EPA's 2016 Regional Screening Levels lowest risk value.

PCBs in building materials were encountered in the following materials at concentrations above 50 ppm:

- Grey Floor Paint – Basement (up to 20,000 ppm)
- Blue Floor Paint – Basement (up to 67 ppm)

Low level detections of PCBs were also encountered in exterior window glaze and caulk (<1 ppm) and White Wall Paint (9 ppm).

Wipe samples were collected of the interior floor surfaces throughout the building to determine if PCBs have impacted or settled on interior surfaces. All 11 wipe samples had detectable concentrations of PCBs with the highest in the areas of PCB containing paint.

Concrete was cored in 14 locations in the basement area where PCB containing paint had been identified. PCBs were identified to have impacted the concrete substrate up to 1.5 inches deep.

2.3.3 KGSNE, LLC, Draft Targeted Brownfields Assessment Report, March 9, 2021

This survey included additional inventory and sampling for asbestos and PCBs, LBP, regulated/universal waste survey, and mold. Five PCB samples were collected and included floor paper, tar, and paint. Gym floor paper, hardwood subfloor paper, light pink paint, and light blue paint had PCB concentrations greater than 1 ppm.

3 TARGETED BROWNFIELD ASSESSMENT APPROACH AND METHODOLOGY - 2023

The Town and their consultant held a meeting with EPA on March 13, 2023 to discuss the project and to seek guidance and acknowledgement on the appropriate path forward. Items discussed included an overview of the project, the previous PCB sampling results, the proposed redevelopment of the Site, the conceptual remedial measures, and data gaps. As a result of the meeting, EPA requested additional PCB characterization sampling and laboratory analyses be conducted to close data gaps and further refine the proposed remedial action. Due to the Town's budgetary constraints, the EPA proposed to conduct the additional sampling required.

Accordingly, a Targeted Brownfield Assessment (TBA) was performed by Nobis Group (Nobis) and their subcontractor KGSNE JV, LLC (KGSNE) in general accordance with the Workplan for Additional Hazardous Building Materials Sampling prepared by Atlas Technical Consultants (Atlas) dated March 20, 2023, the Quality Assurance Project Plan (QAPP) Addendum for St. Johnsbury Armory TBA dated July 10, 2023, and the QAPP Addendum Update dated October 31, 2023.

The purpose of the TBA was to complete additional sampling needed to address data gaps regarding the distribution of RBMs from prior surveys. To meet these objectives, additional suspect building materials and sub-slab soil was sampled for PCB analysis. The work was conducted in two phases:

- Phase 1: sampled suspected PCB and asbestos materials that were not adequately sampled previously and sub-slab basement soils.
- Phase 2: conducted following Phase 1 to further delineate findings from Phase 1 and perform lead-based paint waste stream characterization sampling.

Phase 1 of this work was conducted between August and October 2023 and Phase 2 was conducted in November and December 2023. A full report prepared by KGSNE summarizing the approach and methods is provided in **Appendix C.** A summary of the approach is described below.

3.1 Building Materials

Bulk building material samples were collected by Nobis's subcontractor KGSNE for laboratory analysis to evaluate the presence or absence of PCBs in suspect building materials. A summary of the samples collected is provided in **Tables 2A – 2B. Figures 3A** through **3D** provide the layout of each floor of the building (second floor, first floor, and basement) and sample collection locations.

For each sample a minimum of 2 grams of representative material were collected. Care was taken to ensure that no other materials were intermixed with the sample prior to submittal to the laboratory. For paint samples, a sample representative of the full thickness of wall paint (all layers) was collected. Paint samples were not collected where paint was peeling or chipping; instead, a smooth and intact location was selected for each sample. Prior to sampling, a water-wetted paper towel/rag was used to hand wipe the sampling area with the objective of removing dust or surface grime.

Sampling tools were decontaminated with a diluted hexane spray and deionized water between locations. Quality control samples collected during PCB bulk sampling included field duplicates and matrix spike/matrix spike duplicates. Samples were sent to Pace Analytical Laboratory for PCB analysis. Samples were transported under

chain-of-custody protocol for PCB analysis in accordance with the EPA 3540C Soxhlet extraction method and SW-846 8082 Aroclor analytical method.

On January 16, 2024 CPAI collected eight (8) samples for Toxic Characteristic Leaching Procedure (TCLP) PCB analysis. Samples were collected for waste characterization purposes in support of remedial design. The samples included collection of soil, painted wood, painted concrete, floor tile mastic and painted plaster/lathe.

3.2 Soil

Five sub-slab soil samples were collected for PCBs below the basement slab to test for potential impacts to the soil (see **Figure 3D**) on August 17, 2023. The floor was cored by Cascade Environmental (Cascade) with a 4-inch diameter core into the slab using wet coring methods. A wet-vac was utilized during coring to extract water/slurry from the edge of the core hole so that minimal water/slurry was discharged into the underlying soil. A representative grab sample of soil from the center bottom of each cored hole was collected using decontaminated hand tools.

During Phase 2, 24 soil borings were advanced around the exterior of the building to evaluate the potential for shallow soil impacts (see **Figure 3D**). The locations were predetermined based on high PCB results in Phase I materials samples. Drilex Environmental (Drilex) used a hand-held Geoprobe and hammer drill to advance each boring. Where present concrete was cored ahead of installing the soil boring. Dependent on recovery, soil samples were collected in 0.5-foot intervals to a depth of 5 feet below ground surface (ft bgs), and then in one-foot intervals from depths between 5 and 8 ft bgs. Samples were collected using a dedicated 24-inch acetate macro-core sampling sleeve.

Sampling tools were decontaminated with a diluted hexane spray and deionized water between locations. Soil samples were submitted to Pace Analytical Laboratory for PCB analysis. Quality control samples collected during PCB soil sampling included field duplicates and matrix spike/matrix spike duplicates. Samples were transported under chain-of-custody protocol and submitted for laboratory analysis of PCBs in accordance with the EPA 3540C Soxhlet extraction method and SW-846 8082 Aroclor analytical method. Only the top interval (0-0.5 feet bgs) samples from each location were initially submitted for analysis; all other samples were placed on hold at the laboratory and analyzed as needed given the results of the shallower samples.

4 TARGETED BROWNFIELD ASSESSMENT RESULTS - 2023

4.1 Building Materials

A total of 278 PCB paint/coating samples were collected. The following table presents a summary of the PCB paint/coating results:

Table B – Summary of PCB Paint/Coating Results

Location	Total PCB Paint/Coating Samples	Total Samples Exceeding 1 ppm of PCBs	Total Samples Exceeding 50 ppm of PCBs
Second Floor	48	48	8
First Floor	94	86	8
Basement	96	95	65
Exterior	40	28	11

From Adapted Targeted Brownfields Assessment Hazardous Building Material Assessment dated January 10, 2024 prepared by KGSNE.

Full PCB analytical results for paint/coating samples are included in **Table 2A.**

A total of 24 additional bulk samples were collected and submitted for PCB analysis. PCBs were detected above 50 ppm in three samples of black mastic collected under the floor tile in Room 18 in the basement. The remaining bulk samples collected had PCB concentrations above 1 ppm but below 50 ppm except for copper flashing around the chimney which had a concentration of PCBs below 1 ppm. Full PCB analytical results for bulk building material samples are included in **Table 2B.**

TCLP PCB analytical results identified no detections above the reporting limit and per 40 CFR 761.62(b)(1)(ii) are below the hazardous waste threshold of 10 ug/L.

4.2 Soil

Generally, the concrete of the basement floor was found to be between 2.5 to 5 inches thick. No PCBs were detected in the five sub-slab soil samples collected. Sub-slab soil results are presented on **Table 2C** and **Figure 3C.**

A total of 34 soil samples were analyzed from borings advanced on the exterior of the building for PCB analysis. The following locations reported PCB detections in the 0-0.5 foot interval and had deeper intervals analyzed;

- P-308-Ex (one additional interval analyzed)
- P-313-Ex had two additional intervals analyzed
- P-314-Ex had one additional interval analyzed
- P-315-Ex had two additional intervals analyzed
- P-316-Ex had one additional interval analyzed
- P-321-Ex had one additional interval analyzed
- P-323-Ex had one additional interval analyzed
- P-326-Ex had one additional interval analyzed

The highest concentrations of PCBs were detected in samples collected from boring P-315-Ex. at a concentration of 4.4 ppm in the 0-0.5 foot sample. Total PCBs were reported at a concentration of 1.3 ppm in the 0.5-1.0 foot sample, and at a concentration of 0.097 ppm in the 1-1.5 foot sample. Exterior soil results are presented on **Table 2C** and depicted on **Figure 3D**.

4.3 Data Validation

As described in KGSNE's report included in **Appendix C**, a Tier 1 Stage 2A manual data review (S2AVM) on the analytical data collected during the TBA was conducted. The Tier 1 Stage 2A manual data review was performed in accordance with the Region 1 - EPA New England Environmental Data Review Supplement for Region 1 Data Review Elements and Superfund Specific Guidance/Procedures; EPA's National Functional Guidelines for Organic Superfund Methods Data Review; EPA's National Functional Guidelines for Inorganic Superfund Methods Data Review; the Program QAPP (RFA# 12263), dated October 2022, and the QAPPA for the St. Johnsbury Armory Site, which appends the October 2022 Program QAPP. In general, the data meets the project quality criteria and can be used without restriction. Qualified results are noted in the data summary tables. Limitations and qualification of the data are provided in KGSNE's report provided in **Appendix C**.

5 NATURE AND EXTENT OF CONTAMINATION

Prior surveys have identified PCBs in building materials and soils greater than the cleanup level of 1 ppm. With the highest PCB concentrations detected being 20,000 ppm. The majority of PCBs detected in paint consist of Aroclor 1254 with occasional concentrations of Aroclor 1242. PCB analytical results and extent of PCB impacts are depicted on **Figures 3A** through **3F**.

The highest concentrations of total PCBs have generally been identified in paints especially paint in the basement level, in an exterior stairwell and the southwest loading ramp. In many instances PCB containing paint has impacted underlying substrates including wood, concrete and brick. This includes the wood floors on the first and second floor of the building. It is unknown if wooden floor joists beneath the wood plank flooring has been impacted. Concrete windowsills underlying the PCB containing window caulk and paint was found to not contain PCBs greater than 1 ppm. In addition to the paint and impacted substrates, floor tile mastic was also identified to contain PCBs greater than 50 ppm.

Sub-slab soil samples collected during the TBA has demonstrated that PCBs have not leached to soil below the building slab or exterior stairwell. Exterior soils in the southwest loading dock were found to contain PCBs above the cleanup level of 1 ppm to a depth of 1.5 ft bgs due to deteriorating PCB impacted paint from the adjacent southwest loading dock building.

6 REMEDIAL APPROACH AND ALTERNATIVE ANALYSIS

The proposed remedial action described in **Section 7** and depicted on **Figures 4A** through **4F** (removal/abatement) and **Figure 6** (encapsulation) proposes to address PCB impacted building materials and soil through a hybrid approach:

1. Self-implement cleanup plan per 40 CFR 761.61(a) for PCB impacted building materials and soils greater than 1 ppm total PCBs.
2. Risk-based cleanup and disposal per 40 CFR 761.61(c) for encapsulation of brick, concrete and mortar impacted by overlying PCB containing paint located on walls as shown on **Figure 6**.

The remedial goals presented herein are designed to be consistent with TSCA and VTDEC requirements. The following cleanup standards have been determined to be protective of human health and the environment:

- PCB Cleanup Level proposed for this Site is ≤1 ppm in accordance with 40 CFR 761.61(a)(4) for a high occupancy area.
- For building materials that cannot be removed due to integral structural locations resulting in economic unfeasibility for removal and replacement, an encapsulant will be utilized to prevent future building occupants to be in contact with PCB containing building materials and to prevent off-gassing of residual PCBs. Because the cleanup criteria under the risk-based disposal provisions 40 CFR 761.61(c) are based on the potential for exposure to PCBs following the completion of remediation, published numerical standards need not be applied, provided the remedy is protective.

The above remedial goals are considered protective of human health and the environment, based on the following factors:

- The concentration of PCBs in exposed surface soils will be removed to the ≤1 ppm cleanup level which is protective of human health for potential receptors that contact surface soil, such as site workers, visitors, trespassers.
- The concentration of PCBs in exposed building materials will be removed to the ≤1 ppm cleanup level which is protective of human health for building occupants.
- Engineering controls will be used to control risk of exposure to residual PCBs in basement and eastern gymnasium walls following impacted paint removal. Engineering controls will include use of a two-layer encapsulant coating. Encapsulated PCB impacted walls will be subject to long term monitoring of the condition of the encapsulant and annual PCB air monitoring. The encapsulant will be applied in two layers in two different colors which will allow for damage to the upper layer to be visually observed and repaired prior to full degradation of both layers. The encapsulant will be inspected and its condition documented on an annual basis.
- The encapsulant system will reduce the potential for airborne PCBs since it will create a barrier between the residual PCBs and open air. Annual indoor air sampling and reporting will be conducted following remediation to confirm on-going effectiveness of the encapsulant.
- A deed restriction will be applied with language that all current and future owners must maintain the encapsulant and perform annual air monitoring and reporting.

Based on the above factors the PCB Remedial Plan presented herein is believed to be adequately protective of human health and the environment, as required by 40 CFR 761.61(c). Wetlands, water bodies, sediments or

other similar matrices have not been affected by PCBs on-Site and as such an Ecological Risk Assessment is not applicable.

There are no other feasible alternatives to the risk-based approach for the brick, concrete and mortar walls designated to remain because they are structurally integral to the building and their removal and replacement is not economically feasible. This is documented in the Structural Engineer's assessment letter provided in **Appendix D**. Given the infeasibility to remove these impacted building materials another option was not considered as part of the remedial approach.

Section 7 of this Work Plan consists of the following parts:

- Section 7.1 – General Remedial Construction Information;
- Section 7.2 – Site Preparation;
- Section 7.3 –Reporting;
- Section 7.4 – Particulate Monitoring and Mitigation Plan;
- Section 7.5 – Universal Waste Removal;
- Section 7.6 – Waste Streams and Building Demolition;
- Section 7.7 – PCB Building Material Removal;
- Section 7.8 – Risk-Based Cleanup and Disposal Plan (40 CFR; 761.61(c))
- Section 7.9 – PCB Impacted Soil Excavation;
- Section 7.10 – Decontamination Procedures;
- Section 7.11 – PCB Waste Disposal; and
- Section 7.12 – Contingency Plan.

Post-remediation long term monitoring and maintenance is discussed in **Section 8**.

7 REMEDIAL ACTION PROGRAM

7.1 General Information

7.1.1 Project Organization

The table below summaries the roles and responsibilities involved in the project.

Table C - Project Roles and Responsibilities

Organization	Name	Title	Contact Information	Summary of Responsibilities
Town of St. Johnsbury	Joe Kasprzak	Assistant Town Manager	802-748-3926 X 5 jkasprzak@stjvt.com	Owner
EPA Region 1 Regional PCB Coordination	Kate Woodward	PCB Coordinator	(617) 918-1353 woodward.katherine@epa.gov	Review and Approval of PCB Work Plan and Cleanup Report
EPA Region 1 Brownfields & Sustainable Materials Management Branch	Christine Beling	Project Officer	(617) 918-1792 beling.christine@epa.gov	Oversees Brownfield Grant Administration and Approvals
Vermont Department of Environmental Conservation (VTDEC)	Kassandra Kimmey	Environmental Analyst VI	802-505-8060 kassandra.kimmey@vermont.gov	Vermont Regulatory Oversight
Remediation Contractor (Remedial Contractor)	TBD	TBD	TBD	Contractor responsible for providing all labor, equipment and materials associated with abatement, remediation and demolition activities. Responsible for providing workers with appropriate federal and state abatement licenses.
Montrose Environmental Solutions (Montrose)	Kevin Ignaszak	Senior Principal Engineer	(716) 329-0672 kignaszak@montrose-env.com	Town of St. Johnsbury Environmental Consultant - Lead Remediation Engineer and Construction Oversight
Montrose Environmental Solutions (Montrose)	TBD	Field Support	TBD	Oversee PCB remediation activities, perform particulate monitoring, collect post-remediation samples
Clay Point Associates Inc (CPAI)	Todd Hobson	Environmental Associate	802.343.4809 hobson@claypointassociates.com	Asbestos and Lead Based Paint Abatement Design and Oversight

7.1.2 Remedial Action Sequence

The proposed project schedule is discussed **Section 9**. The estimated construction timeframe to complete the remedial action is approximately 14 weeks, contingent upon the selected Remedial Contractor's submitted schedule, and is anticipated to be completed in the following stages:

Stage 1: Preparing and submitting a Generator's Waste Profile to the disposal facility and obtaining landfill approval. Additional waste characterization samples may need to be collected to satisfy disposal facility requirements. This could occur at the time of the pre-construction meeting, if required.

Stage 2: Mobilize to Site and complete Site Preparation activities.

Stage 3: Perform building material remediation, install building bracing structures and perform demolition work. Building demolition will be broken into two phases, contingent upon the selected Remedial Contractor's proposed sequence to complete the work. Phase A will consist of abatement and demolition of the western portion of the building including the gymnasium. Phase B will include abatement of the eastern portion of the building that will remain.

Stage 4: Following completion of the abatement in Phase B, collect PCB verification samples and apply encapsulant to designated PCB impacted basement foundation and eastern gymnasium walls that are to remain.

Stage 5: Excavation of PCB impacted soil adjacent to southwest loading dock. Collect post excavation verification soil samples with expedited turnaround of two-three business days following receipt by lab. Following receipt of sample results import clean fill and backfill the excavation.

Stage 6: Complete waste loadout and miscellaneous activities.

Stage 7*:* Demobilization from the site.

Heavy equipment decontamination and collection of verification wipe samples for confirmation of residual PCBs with expedited turnaround of two-three business days following receipt by lab, will be completed as needed and prior to removal of equipment from the Site.

7.1.3 Work Hours

Construction activities are expected to occur between 7:00 am to 5:00 pm, Monday through Friday, excluding holidays. Work hours will not occur during the Town of St. Johnsbury's prohibited times for construction noise (9 PM to 6 AM) per the Code of Civil Ordinances Amendment Chapter 8 Objectionable Noise (11/26/2012).

7.1.4 Site-Specific Health and Safety Plan (HASP)

Before the commencement of field activities, the Remedial Contractor, Montrose and CPAI will prepare site-specific HASPs in accordance with Title 29 of the U.S. Code of Federal Regulations, part 1910.12, for their respective personnel. All workers will be subject to Site-specific safety training. Attendance at a daily safety briefing will be mandatory for all workers (Remedial Contractor, Montrose and CPAI).

7.1.5 Quality Assurance Protection Plan

Quality Assurance/Quality Control (QA/QC) procedures will be followed in accordance with Montrose's QAPP (QA#24013) approved December 8, 2023 and Site Specific QAPP Addendum (SSQAPPA) being prepared simultaneously with this Work Plan under a separate cover.

7.1.6 Worker Training and Monitoring

Site workers involved with the handling of contaminated materials will have up-to-date OSHA HAZWOPER certification, medical monitoring and a respirator fit-test. Workers will have the appropriate state and federal training and licences for conducting RBM abatement and remediation.

7.1.7 Agency Approvals

The Work Plan will be performed following approval by the Regional EPA Coordinator. Montrose's staff will oversee the implementation of this Work Plan and CAP. CPAI will oversee asbestos and LBP abatement which is expected to occur simultaneously with this Work Plan. Other local permits or government approvals required for the remedial construction activities will be obtained prior to the start of remedial construction by the Remedial Contractor.

7.2 Site Preparation

7.2.1 Kickoff Meeting

One week prior to the start of abatement work, a kickoff meeting will be held at the Site with the Town of St. Johnsbury, Montrose, CPAI and the Remedial Contractor. The objective of this kickoff meeting will be to provide a general overview of the work, review of roles and responsibilities, material management requirements (including necessary approvals) during ground intrusive and abatement work, provide an overview of the particulate air monitoring activities, triggers and corrective actions, provide an overview of truck and equipment decontamination procedures, wipe sample confirmation samples, and an overview of post removal confirmatory sample procedures and timeframes. Montrose and CPAI will prepare an agenda and organize the meeting. If needed, depending on the Remedial Contractor's selected disposal facilities, additional waste characterization samples may be collected following the meeting.

7.2.2 Construction Office Trailer and Sanitary Facilities

The Remedial Contractor will mobilize a construction office trailer complete with heat, electric, drinking water as well as temporary sanitation facilities. Montrose and CPAI will need to use a portion of the construction office trailer for staging and charging equipment, preparing and shipping bottleware, etc.

7.2.3 Erosion and Sedimentation Controls

Best Management Practices will be employed by the Remedial Contractor for erosion and sediment controls (ESCs) including silt fence, bermed and lined material stockpiles, stabilized construction entrances, vehicle decontamination and dust control measures, as needed. Existing concrete and asphalt surfaces will be kept free of loose soil/dust to minimize the amount of potentially mobile sediment discharge into the sewers.

7.2.4 Site Fencing

The General Contractor will construct a temporary 6 ft tall construction fence around the Site. The fence will contain three locking gates. The Remedial Contractor shall maintain the integrity of the perimeter fence, gates and shall lock the gates during non-working hours. In addition to the Site perimeter fence, the Remedial Contractor shall erect and maintain orange construction fencing surrounding open subsurface excavations until excavations have been backfilled to surrounding grade.

7.2.5 Stabilized Construction Entrance

The Remedial Contractor will be responsible for ensuring that egress points for truck and equipment transport from the Site will be clean of dirt and other materials derived from the Site during remediation. Locations where vehicles enter or exit the Site shall be inspected daily for evidence of off-site sediment tracking. Cleaning of the adjacent streets will be performed as needed by the Remedial Contractor to maintain a clean condition with respect to Site-derived materials.

7.2.6 Pedestrian and Traffic Safety

Vehicular and pedestrian traffic is present in the vicinity of the Site. The existing sidewalk to the east of the armory building will be kept open and maintained for pedestrian traffic. The Remedial Contractor will provide a worker(s) at the Site entrance with flaggers, when deemed necessary, to ensure safe entry and exit of vehicles.

7.2.7 Utility Clearance

The Remedial Contractor will be responsible for the identification of utilities that might be affected by work under the Work Plan and for implementation of all required, appropriate, or necessary health and safety measures during performance of work. The Remedial Contractor will be responsible for safe execution of all invasive and other work performed under this Work Plan. The Remedial Contractor will obtain the local, State, or Federal permits or approvals pertinent to such work that may be required to perform work under this Work Plan.

7.2.8 Building Bracing and Excavation Shoring

The structural stability of excavations and on-Site and off-Site structures will be appropriately managed by the Remedial Contractor during on-site activities, including excavation and backfilling. The Remedial Contractor will be required to retain a licensed structural engineer to design the necessary excavation shoring and the building bracing system to maintain the western wall of the building and the eastern portion of the gymnasium walls designated to remain. The Remedial Contractor will install the bracing system before demolition takes place and it shall be maintained until removed by the General Contractor during building re-construction.

7.2.9 Equipment and Material Staging

An Equipment and Material Staging Area will be designated in a portion of the Site away from areas that will require remediation, as feasible. As demolitions and excavations are planned throughout the Site, multiple equipment and material staging areas may be required for different phases of work. Decontamination Areas will be designated in portions of the Site near the areas that will require remediation.

7.2.10 General Work Practices

PCB building material remediation, ACM abatement and LBP removal will occur simultaneously. The Remedial Contractor will follow the general work practices prescribed in the Asbestos Design Contract Documents. An example of general work practices that apply to PCB building remediation is included in **Appendix E**. These work practices will be revised to be site specific in the final Contract Documents. General asbestos abatement work practices that will be employed during PCB building material removal work include:

- Pre-cleaning;

- Worker Decontamination Structure;
- Waste Load-Out Structure;
- Critical Barriers;
- Critical Barrier Inspection;
- Containment Barriers;
- Negative Pressure Differential/Filtration;
- Inspection of Setup Procedures;
- Initial Cleaning;
- Initial Visual Inspection;
- Takedown of Containment Barriers;
- Cleaning of the Abatement Work Area;
- Visual Inspection;
- Removal of Critical Barriers; and
- Final Inspection.

7.3 Reporting

7.3.1 Daily Reports

At the end of each workday, the Remedial Contractor's Site Superintendent, CPAI and Montrose's Field Team Leader will meet to discuss and agree upon the work completed for the day, including labor, equipment, and materials delivered, utilized, or removed from the Site and other pertinent field items in writing. On a daily basis, Montrose will also take pertinent photographs to document the work, track all waste manifests, pertinent quantities, and particulate air monitoring data. The anticipated work to be completed for the following two-to-three days will also be discussed and understood to keep the parties aligned and minimize future issues from arising.

7.3.2 Weekly Reports

By the close of business each Monday, Montrose will provide a Weekly Report summarizing the prior week's activities to the Town of St. Johnsbury. The Weekly Report will provide a high-level summary based on the Daily Reports compiled from the prior week's completed activities.

7.3.3 Complaint Management Plan

In the event they should arise, public complaints regarding the construction activities will be immediately discussed between the Remedial Contractor, Montrose, CPAI and the Town of St. Johnsbury. The Remedial Contractor will be responsible to resolve the issue expeditiously once a solution is developed. In the event of a health-related public complaint, the Town of St. Johnsbury and Montrose must be notified as soon as possible, or within 24 hours of the occurrence.

7.4 Particulate Monitoring and Mitigation Plan

The handling of PCB impacted materials has the potential to emit impacted particulates (dust) into the surrounding air. Therefore, exterior particulate (dust) mitigation procedures along with real-time particulate

(dust) monitoring by Montrose will be required throughout the remediation process when impacted material is being actively handled or managed by heavy construction equipment.

7.4.1 Objective

To prevent community exposure to PCB impacted particulates (dust) during impacted material removal and handling, Particulate (Dust) Mitigation Procedures (PDMPs) in conjunction with a real-time particulate (dust) monitoring plan will be implemented. The following subsections describe the means and methods by which this Particulate (Dust) Mitigation & Real-Time Monitoring Plan will be implemented.

7.4.2 Scope of Dust Generating Activities

The general scope of dust generating site remediation work consists of the following:

- Removal of PCB containing building materials;
- Demolition activities;
- Loading of PCB impacted building material for off-site transport; and
- Excavation and loading of PCB impacted soil for off-site transport.

7.4.3 Particulate (Dust) Mitigation Procedures

Real-time monitoring of particulates that are 10 micrometers or smaller (PM_{10}) will be performed during the management of impacted material. Based on the results of real-time PM_{10} monitoring described below, active PDMPs mitigation controls may need to be implemented to mitigate the potential for fugitive dust emissions from the Site.

7.4.3.1 Water Application

Water application may be used to suppress the generation of fugitive dust during demolition, excavation and impacted material handling. When water is used as a PDMP, it will be applied utilizing a water truck in a manner to suppress dust on temporary haul routes, stockpiles, and any other areas as required. In addition, direct spray may also be applied through the use of a hose for more targeted dust mitigation at the Site including during building demolition activities. Water runoff from the Site will not be allowed during dust suppression water application activities.

7.4.3.2 Vehicular (Administrative) Procedures

The following vehicular practices shall be followed to minimize dust generation:

- All vehicles are required to maintain slow speeds while on-site (less than 5 miles per hour) for general safety as well as dust control measures;
- Vehicle traffic in non-designated travel areas shall be minimized;
- Trucks will minimize traversing in areas containing impacted soil; and
- All haul trucks shall be covered with tarps prior to transporting impacted material off-site in accordance with US Department of Transportation (DOT) regulations as well as all State and local regulations.

7.4.3.3 Negative Pressure

As required for asbestos abatement, interior areas will be under negative pressure during interior abatement work. Negative pressure will help reduce the potential for impacted particulates to leave the work zone. Negative pressure containments will be monitored as per the Asbestos Design Contract Documents.

7.4.3.4 Real Time Particulate (PM_{10}) Monitoring Plan

Real-time PM_{10} monitoring of the ambient air will be conducted during remediation activities to monitor potential impacts to the downwind community. As a component of this approach, air monitoring will be conducted at designated upwind, and downwind locations that will vary depending on daily prevailing wind patterns, and adjusted as necessary. For interior work the "downwind" location will be located immediately outside the entrance to the containment and the "upwind" location will be a background station located elsewhere in the building or outside where abatement work is not taking place. For exterior work the downwind location shall be located along the perimeter of the work area so that the monitor location is directly downwind of the center of potential dust generating activities. In addition, fugitive dust migration will be visually assessed by Montrose during work activities.

The PM_{10} monitoring program will consist of real-time monitoring for particulate matter that are less than ten micrometers in size using a TSI DustTrak™ DRX 8533 or equivalent device that can provide instantaneous (real-time) data, can autocorrect for relative air humidity, and is able to operate at a sample integration time of 15 minutes or less.

7.4.3.5 Particulate PM10 Action Levels

The notification and action levels for particulate matter in ambient air for 10-hour average concentrations of PM_{10} (particulate matter with a diameter less than 10 micrometers) are 120 µg/m^3 and 150 µg/m^3, respectively. The action level is equivalent to the current 24-hour National Ambient Air Quality Standard (NAAQS) for PM_{10} (150 µg/m^3). The notification level represents 80 percent of the action level and has been selected to allow notice before concentrations reach the level of the 24-hour NAAQS.

For each day of monitoring, the particulate data from the down-wind on-Site monitor will be compared with the date from the upwind (background monitoring). In the event that a 10-hour average PM_{10} concentration at a monitoring location exceeds the action level, Montrose will immediately notify the Remedial Contractor, and the Remedial Contractor will:

- Temporarily cease remediation activities;
- Hold a discussion with Montrose regarding the appropriate immediate or short-term response actions to address the action level exceedance and their implementation; and
- Confirm with Montrose that the response action was effective.

Montrose will provide written notice of an action level exceedance to the Town of St. Johnsbury, the EPA Brownfields Project Officer and VTDEC within 72 hours after receiving notification of the exceedance. The notice will include the duration of the exceedance and a description of the corrective actions taken.

The dust monitors will be equipped with an audible alarm when instantaneous readings are in excess of the 10-hour average PM_{10} notification level. Upon audible alarm notification, remediation activities will temporally cease to implement PDMPs described above. After implementing PDMPs and upon resuming Site remediation activities, Montrose will closely monitor instantaneous readings to determine if the PDMPs were effective in reducing instantaneous readings below the 10-hour average PM_{10} notification limit and implement the frequency of PDMP application or additional PDMPs if necessary. If the PDMPs described herein are found to be not effective in reducing instantaneous particulate levels below the 10-hour average PM_{10} notification limit, remediation activities will cease and corrective actions will be implemented that may include but are not limited to not working in high wind conditions, increasing the frequency of PDMP applications, or implementing alternative PDMPs not explicitly described in this plan.

7.4.3.6 Meteorological Monitoring

Hourly meteorological data from the Automated Surface Observation System (ASOS) Monitoring operated at the Caledonia County Airport (ID: KCDA) will be included with the sampling results. The National Weather Service, Federal Aviation Administration, and the Department of Defense operate the ASOS Monitoring Station. The ASOS Monitoring measures and records wind speed, wind direction, precipitation, temperate, sky conditions, barometric pressure, and relative humidity.

7.4.3.7 Particulate Monitoring Quality Assurance and Quality Control (QAQC) Procedures

Equipment audible alarm checks will be conducted at the start of each workday. Montrose will operate within hearing distance of the alarm in order to properly notify the Remedial Contractor that instantaneous particulate levels are exceeding the 10-hour PM_{10} notification limit so that PMDPs can be promptly implemented.

Calibration and maintenance of PM_{10} monitoring stations and any other applicable QAQC procedures will be conducted by Montrose by the method and frequency recommended by the equipment manufacturer.

7.4.3.8 Documentation and Reporting

Air monitoring records will be maintained electronically. Particulate data will be summarized daily and a weekly summary will be included in the Weekly Report described in **Section 7.3.2**. The final report will summarize the results of particulate monitoring and will include:

- Dates and times of monitoring;
- Description of sample locations by date;
- Calibration and maintenance records;
- Narrative summary of real time data by data, particulate mitigation methods used, meteorological. data and discussion of any notification or action 10-hour PM10 exceedance; and
- Electronic copy of meteorological and real time particulate data for each monitoring station.

7.5 Universal Waste

Universal wastes encountered during prior surveys have included compact fluorescent bulbs, fluorescent light tubes/ballasts, exit sign/lights, batteries, thermostats, fire extinguishers, and various containers with residual cleaning solutions/paints/adhesives. Prior to the start of demolition activities Universal Waste will be removed and disposed of in accordance with state and federal regulations.

7.6 Waste Streams and Building Demolition

The following materials and quantities have been identified as containing PCBs >50 ppm:

Table D – Summary of Materials Containing Total PCBs > 50 ppm

Description	Quantity (tons)	Notes:
PCB TSCA Haz-Waste: Dried paint - failing TCLP for lead (classified as D008 hazardous waste) and with PCBs > 50 ppm. Includes PCB Paint Chips/Dust/Debris/ACM on floors, plus disposal of all ductwork, electrical, plumbing, etc. with PCB and Asbestos dust.	40	
PCB TSCA Haz-Waste: Building demo debris with asbestos. Plaster, joint compound, insulation, cloth, door(s), caulk. (friable and non-friable) Includes paint with PCBs >50 ppm and haz lead paint	21	Includes ACM and/or Haz PCB and/or Haz Lead in **Basement:** 11 tons of plaster/drywall; **1st floor:** 10 tons of plaster/lathe; **Gym and 2nd Floor:** 0 tons = **21 tons**
PCB TSCA Haz-Waste: Concrete Rubble with PCB paint levels > 50 adhered to substrate (Conversations with EPA Region 1 PCB Coordinator suggest this would be considered bulk product waste). Brick, concrete rubble, cinder blocks.	294	Includes **Basement:** 272 tons of exterior/Interior Concrete/Masonry Walls and concrete slab + 3 tons of protective plywood on floor + 0.5 tons of Stairwell 0-1 wood; **1st Floor**: 0.5 tons of Stairell 1-2 wood; **Gym:** 0 tons; **2nd floor:** 2 tons red trim + two doors + wood flooring; **Exterior:** 16 tons north central stairwell + southwest loading ramp = **294 tons**

The following materials and quantities have been identified as containing PCBs >1 ppm but <50 ppm:

Table E – Summary of Materials Containing Total PCBs >1 ppm but < 50 ppm

Description	Quantity (tons)	Notes:
PCB Non-Haz Remediation Waste: Building demo debris with asbestos. Plaster, joint compound, insulation, cloth, door(s), caulk. (friable and non-friable) Includes paint with PCBs >1 but < 50 ppm and non-haz lead paint	246	Includes ACM debris in **Basement:** 53 tons of plaster/drywall + 5.5 tons wood framing +1 ton pipe insulations + 2.5 ton boiler; **1st Floor + E. Wall of Gym:** 86 tons of plaster/drywall/studs; **2nd Floor:** 85 tons of plaster/drywall/studs; **Exterior:** 13 tons of roof flashing, coating and caulking materials = **246 tons**
PCB Non-Haz Remediation Waste: Building demo debris with non-haz lead paint and with PCBs > 1 but < 50 ppm. Wood, painted metal, plaster, lath, concrete rubble, brick, cinder blocks, window frames w/glass, etc.	582	Includes **Basement:** 264 tons of exterior/Interior Concrete/Masonry Walls and concrete slab; **1st Floor**: 2 tons of wood flooring; **Gym:** 39 tons of floor and ceiling + 20 tons trusses + 246 tons exterior masonry walls; **2nd floor:** 0 tons; **Exterior:** 10 tons north central/west stair and canopies; 1 ton front doors and railings = **582 tons**
PCB Non-Haz Remediation Waste: Soils containing PCBs under 10 ppm	10	

PCB impacted building materials proposed to be removed from the Site will be separated into the following three waste streams.

- Hazardous PCB Remediation Waste - Includes loose paint not adhered to substrate with concentrations >50 ppm.
- Non-Hazardous PCB Remediation Waste - Includes soil and painted substrates (such as wood and concrete) with concentrations >1 ppm but <50 ppm.
- PCB Bulk Product Waste - Includes painted substrates with concentrations > 50 ppm such as painted wood and concrete surfaces.

Demolition will be implemented in a controlled manner to minimize cross-contamination of waste streams.

Detailed building demolition plans are presented in **Figures 4A** through **4E**. The anticipated demolition sequence for PCB impacted building materials is expected to be as follows, but may be modified based upon input by the selected Remedial Contractor. It is anticipated that the building will be abated/demolished in two sections. First section will be the gymnasium/ western portion of the building which will be demolished (Phase A) and the second section will the eastern portion of the building which will be renovated (Phase B). The below sequence does not account for ACM and LBP removal which will occur simultaneously.

1. **Phase A- Gymnasium/Western Portion of Building:** Conduct pre-cleaning activities, set-up containment and set-up waste load out structure(s).
    a. Scrape all loose and peeling paint from all surfaces and clean using wet cleaning methods and/or HEPA vacuuming techniques. Dispose of these materials as Hazardous PCB Remediation Wastes.

b. Begin to selectively remove materials designated as PCBs ≥50.0 ppm in the gymnasium (Level 1) per **Figure 4B**, western portion of the basement area as shown on **Figure 4C,** and exterior areas of the western building per **Figures 4D and 4E**, excluding the floor of the basement. Dispose of these materials as PCB Bulk Product Waste.
c. Selectively remove materials designated as PCBs ≥1.0 ppm and <50.0 ppm in the western portion of building as shown on **Figures 4B, 4C, 4D** and **4E,** excluding the floor of the basement. Dispose of these materials as Non-Hazardous PCB Remediation Waste.
d. Protect the basement flooring during demolition of the western portion of the building by placing two (2) 6-mil layers of polyethylene sheeting followed by 0.75-inch thick plywood.
e. Install structural bracing and shoring, segregate (dismantle/cut) the gymnasium walls from those designated to remain, the gymnasium is imploded into basement followed by debris loaded out.
f. Remove protective plywood and polyethylene sheeting, basement concrete slabs, dispose as either PCB Bulk Product Waste or Non-Hazardous PCB Remediation Waste (as designated),and backfill the area.

2. Part B – Eastern Portion of Building

a. **Second Floor:** Conduct pre-cleaning activities, set-up containment and set-up waste load out structure(s).
    i. Scrape all loose and peeling paint from all surfaces and clean using wet cleaning methods and/or HEPA vacuuming techniques. Dispose of these materials as Hazardous PCB Remediation Wastes.
    ii. Begin to selectively remove materials designated as PCBs ≥50.0 ppm on **Figure 4A**, excluding the floor. Dispose of these materials as PCB Bulk Product Waste.
    iii. Selectively remove materials designated as PCBs ≥1.0 ppm and <50.0 ppm on **Figure 4A**. Dispose of these materials as Non-Hazardous PCB Remediation Waste.
    iv. Complete demolition on the second floor by removing flooring. Dispose of these materials as PCB Bulk Product Waste.
    v. Handscrape and collect any visible residue remaining on the surface of the wood ceiling rafters or floor joists to a maximum depth of 1/4 inches. Clean debris with HEPA vacuum. Clean remaining wood surfaces with HEPA Vacuum. Clean remaining concrete and masonry surfaces with water-wetted paper towel/rag, followed by a hexane-wetted paper towel/rag. Repair chiseled areas with a leveling course.
    vi. Montrose will then collect verification samples of the remaining floor joists in accordance with **Figure 5A** and **Table 3**. Use leveling course on wood floor joists to repair sample locations and other areas chiseled away during cleaning.
    vii. If verification samples are above 1 ppm then encapsulant will be applied per **Section 7.12.**
    viii. After receipt of analytical results remove containment and waste loadout structure.
b. **First Floor:** Conduct pre-cleaning activities, set-up containment and set-up waste load out structure.
    i. Scrape all loose and peeling paint from all surfaces and clean using wet cleaning methods and/or HEPA vacuuming techniques. Dispose of these materials as Hazardous PCB Remediation Wastes.

ii. Begin to selectively remove materials designated as PCBs ≥50.0 ppm on **Figure 4B**. Dispose of these materials as PCB Bulk Product Waste.
iii. Selectively remove materials designated as PCBs ≥1.0 ppm and <50.0 ppm on **Figure 4B**. Dispose of these materials as Non-Hazardous PCB Remediation Waste.
iv. Handscrape and collect any visible residue remaining on the surface of the wood ceiling rafters, floor joists to a maximum depth of 1/4 inches. Clean debris with HEPA vacuum. Clean remaining wood surfaces with HEPA Vacuum. Clean remaining concrete and masonry surfaces with water-wetted paper towel/rag, followed by a hexane-wetted paper towel/rag. Repair chiseled areas with a leveling course.
v. Dry ice blast paint off the eastern portion of the gymnasium walls as shown in **Figure 6A** until visible paint is no longer visible (maximum depth of 1/8 inches) and dispose as Non-Hazardous PCB Bulk Remediation Waste (Total PCBs< 50 ppm).
vi. Montrose will collect post remediation samples of the walls to remain as shown on **Figure 5B** and **Table 3** following cleaning. Following receipt of results apply two layers of differential color encapsulant coating on walls to remain as show in **Figure 6A** and discussed in **Section 7.8**.
vii. Remove containment and waste loadout structure following visual inspection.

c. **Basement Level**: Conduct pre-cleaning activities, set-up containment and set-up waste load out structure on the basement level.
i. Scrape all loose and peeling paint from all surfaces and clean using wet cleaning methods and/or HEPA vacuuming techniques. Dispose of these materials as Hazardous PCB Remediation Wastes.
ii. Begin to selectively remove materials designated as PCBs ≥50.0 ppm on **Figure 4C**. Dispose of these materials as PCB Bulk Product Waste.
iii. Selectively remove materials designated as PCBs ≥1.0 ppm and <50.0 ppm on **Figure 4C**. Dispose of these materials as Non-Hazardous PCB Remediation Waste.
iv. Dry ice blast paint off brick, concrete and mortar wall as shown in **Figure 4C** until visible paint is no longer visible (maximum depth of 1/8 inches) and dispose as Hazardous PCB Bulk Remediation Waste (Total PCBs> 50 ppm).
v. Handscrape and collect any visible residue remaining on the surface of the ceiling rafters, wood studs and remaining walls. Clean remaining wood surfaces with HEPA Vacuum. Clean remaining concrete and masonry surfaces with water-wetted paper towel/rag, followed by a hexane-wetted paper towel/rag. Repair chiseled areas with a leveling course.
vi. Montrose will collect post remediation samples from basement walls to remain as shown on **Figure 5C** and **Table 3** following cleaning. Following receipt of results apply two layer of differential color encapsulant coating on walls to remain as show in **Figure 6B** and discussed in **Section 7.8**.

d. Remove containment and waste loadout structure following visual inspection.

3. Complete remaining exterior abatement as shown on **Figures 4D** and **4E**. Use dust suppression during removal.

4. Perform soil remediation per **Section 7.9,** the CAP and its Amendment.
5. Miscellaneous completion activities, including final demolition and construction, Site cleanup, and disposal prior to turning the Site over to the General Contractor.

7.7 PCB Building Material Removal

The following summarizes the general procedure of removal of PCB building materials. Detailed building demolition plans are presented in **Figures 4A** through **4E**. Asbestos containing materials and lead based paint will be removed in accordance with Design Specifications currently under development.

- Work surfaces will be wetted as feasible to minimize dust during removal.
- Remove materials as shown in **Figures 4A** through **4E** using the general sequence provided in **Section 7.6**. As feasible removal of impacted materials shall be done with hand tools to minimize vibrations resulting in dust generation.
- As indicated in **Figure 4C** the presence and color of the flooring needs to be verified in Rooms 19 and 20 (boiler room). Given significant dust and grime building it could not be determined at the time of the TBA if the flooring in this area is painted. Following the initial cleaning floor paint color, if any, will be verified and compared against other results of other paints sampled to evaluate proper disposal. If needed, additional samples will be collected to evaluate the PCB content.
- Upon the completion of the initial removal activities, Montrose will visually inspect remaining building materials for potential residual PCB impacted building materials and paint that may have seeped to underlying/adjacent building materials. If paint is observed on the adjacent/underlying materials it will be removed and/or chiseled away until paint is no longer visible. For example, if paint is observed to have seeped to wooden floor joists through cracks in the first and second floors then the impacted wood will be chiseled out until no more paint is visible, or to a maximum depth of 1/4 inches. A leveling course will subsequently be applied in areas that were chiseled. See **Section 8** Contingency regarding encapsulation if this condition is encountered on the wooden floor joists.
- Waste debris generated during this project will be immediately collected and stored in labeled Hazardous PCB Remediation Waste, Non-Hazardous PCB Remediation Waste or PCB Bulk Product Waste containers at the end of each work shift. Waste shall be disposed of according to applicable regulatory requirements summarized in **Section 7.11.**
- Generally, after removal of impacted building materials the remaining building materials will be cleaned as follows:
    - Handscrape and remove any visible residue remaining on the surface.
    - Collect removed debris with HEPA vacuum.
    - HEPA vacuum remaining wood surfaces.
    - Clean remaining concrete and masonry surfaces with water-wetted paper towel/rag, followed by a hexane-wetted paper towel/rag.
- During work, equipment and tools used in the process will be decontaminated as specified in **Section 7.10**.

During basement slab removal dewatering is not anticipated due to the expected depth of excavations relative to depth to anticipated groundwater at the Site (over 25 ft bgs). The basement area will be backfilled and compacted

to within 6 inches of surrounding grade with clean fill soil, sand borrow material comprised of VTrans Standard Spec 703.03 (or approved equal), from a known off-Site source for which the material has been confirmed to be non-impacted and to meet the criteria for unrestricted land use.

7.7.1 Second Floor Building Material Verification Sampling

Following floor removal on the second-floor wood planking, verification samples will be collected of wood floor joists to evaluate if they have impacted by PCB containing paint. Samples will be collected by Montrose using a hand chisel. Samples shall be collected as shown on **Figure 5A** and in **Table 3**, or in locations where visible paint had been removed. In general, three samples will be collected per room/area. A water-wetted paper towel/rag will be used to hand wipe the sampling area prior to collecting the sample, with the objective of removing dust or surface grime.

For each sample at least 10 grams of wood will be collected. Samples will be collected to a maximum depth of 1/4 inches and in a way that does not impact the structural integrity of the wood floor joists. Attempts will be made to collect wood samples from a single, grab sample location; however, in order to maintain structural integrity of the floor joists, wood chips may need to be collected over an area across multiple adjacent floor joists and then be composited together. If necessary, composite samples will be collected from like materials, for example four discrete samples will be collected from four contiguous floor joists located equal distance from the wall. Following sample collection a leveling course will be used to repair sample locations by the Remedial Contractor.

Field notes collected during sampling will indicate date and time of collection, description of location, and include floor plan notations showing the exact location of the sample. Sampling will be completed per the December 2023 QAPP (QA#24013). In addition, one field equipment rinsate blank per non-dedicated piece of equipment and one matrix spike/matrix spike duplicate (MS/MSD) sample per twenty samples and one duplicate building material sample per ten samples for QA/QC purposes. Sampling tools shall be decontaminated between samples by first removing gross contamination, and then performing a final wipe using a clean hexane-wetted paper towel/rag. All samples shall be placed in laboratory-supplied jars and transported under chain-of-custody protocol to a certified laboratory for PCB analysis in accordance with the Method 3546 Microwave Extraction method and SW-846 8082 Aroclor analytical method. If samples are composited, mathematical correction will be applied to account for dilution.

7.8 Risk-Based Cleanup and Disposal Plan (40 CFR 761.61(c))

7.8.1 Location and Quantity of Impacted Building Materials

Approximately 6,250 sq. ft. of PCB impacted concrete, brick or motor walls will remain in the basement of the building and the eastern portion of the gymnasium walls following paint removal. The location of the walls to remain are depicted on **Figures 6A and 6B.**

7.8.2 Paint Removal

Paint will be removed from walls using dry ice blasting methods (or approved equal) in order to reduce amount of waste generated compared to sand blasting methods. Designated walls will be stripped until no visible paint is remaining (maximum depth 1/8 inches). Following dry ice blasting, all surfaces will be brushed off with a stiff

bristled brush and then vacuumed with a HEPA equipped filter. Following vacuuming the area will be wiped down first a water-wetted paper towel/rag, followed by a hexane-wetted paper towel/rag or disposable rag.

Paint, blasting media waste and decontamination waste will be transferred into 55-gallon DOT steel drums, or waste roll off container, with appropriate waste labeling for off-site disposal as Hazardous PCB Remediation Waste.

7.8.3 Post-Paint Removal Sampling

Following the paint removal procedure and cleaning described above, sampling of the designated wall surfaces will be completed to evaluate the residual PCB impacts to these areas. The purpose of the post-paint removal sampling is to document the concentrations of residual PCBs that may remain prior to encapsulation. As such, no additional remediation is proposed following sample collection.

One sample will be collected per wall immediately following cleaning with a bias to areas which previously exhibited the highest PCB concentrations prior to paint removal. Proposed sample locations are shown on **Figures 5A and 5B** and described on **Table 3.** Bulk samples will be collected by removing a minimum of 10 grams of representative material from suspected media using hand tools or a drill. Samples shall be collected to a depth of 1/2 inch.

Sampling will be completed per the December 2023 QAPP (QA#24013). In addition, one field equipment rinsate blank per non-dedicated piece of equipment, one duplicate building material sample per ten samples and one MS/MSD sample per twenty samples will be collected for QA/QC purposes. Sampling tools shall be decontaminated between samples by first removing gross contamination, and then performing a final wipe using a clean hexane-wetted paper towel/rag. All samples shall be placed in laboratory-supplied jars and transported under chain-of-custody protocol to a certified laboratory for PCB analysis in accordance with the Method 3546 Microwave Extraction method and SW-846 8082 Aroclor analytical method.

7.8.4 Encapsulation

The proposed encapsulant is Retro CoatTM provide by Land Science, a division of REGENESIS®. Retro-Coat™ will serve as a physical and vapor barrier for residual PCB the walls that are to remain. Although Retro-Coat™ has not specifically been shown to protect against off-gassing of PCB building materials, it has been demonstrated to be an effective vapor against volatile organic compounds (VOCs). Immediately following the collection of post-paint removal samples, a Land Science certified subcontractor will proceed to encapsulate the remaining walls of the basement and gymnasium. The foundation and gym walls designated to be encapsulated total approximately 6,250 square feet (SF) as shown on **Figures 6A** and **6B**. Encapsulation will consist of the following process:

1. Cover and protect the area as needed.
2. Perform necessary structural repairs and fill in open cracks 1/2” and greater should be v-notched to a 3/4” width by 1/2”with Retro-Coat Gel and allow to dry before next step.
3. Wipe down and hand sand surfaces to remove any loose material and vacuum for a final preparation. Prior to application walls must be dry, clean and structurally sound.
4. Apply a 6-mil layer primer coat of colored Retro Coat™ to the designated walls.

5. Apply one 20-mil coat of colored Retro Coat™ to the designated walls.
6. Remove the protective coverings.

The two coats of the encapsulant will be applied in accordance with manufacture's recommendations and in contrasting colors such that wear of the top layer may be more easily observed during the annual inspections (see **Section 8**, Long-Term Monitoring and Maintenance Plan). For Retro-Coat is expected to be applied either through spray application method as approved by the manufacturer or rolled on. Copies of the information sheets as well as the Safety Data Sheets components for Retro Coat™ is included **Appendix F.**

7.9 PCB Impacted Soil Excavation

PCB-impacted soil above the 1 ppm PCB Cleanup Level is present adjacent to the southwest loading dock to a maximum depth of 1.5 ft bgs. **Figure 3D** shows PCB soil analytical results and the extent of the proposed excavation area is shown on **Figure 4F**. The PCB Cleanup Level proposed for Site soils is ≤1 ppm in accordance with 40 CFR 761.61(a)(4) for a high occupancy area. An estimated 5 cubic yards (CY) of PCB impacted soil will be removed following building demolition activities.

Prior to excavation work, excavation areas will be properly identified. Excavations areas may be located by means of GPS, field measurements or similar. Excavation extents and will be marked with flags, poles or stakes. Excavations depths must be identified on the selected marker.

Montrose will oversee invasive work and the excavation and load-out of excavated material. The Remedial Contractor is responsible for safe execution of invasive work. Proposed details and notes related to excavation are shown on **Figure 4F.**

Additional non-PCB impacted soil will be excavated in unpaved areas of the Site to remove other contaminants per the VTDEC approved CAP.

7.9.1 Excavation Water

Dewatering is not anticipated due to the expected depth of excavations (~1.5 ft bgs) relative to depth to groundwater at the Site (over 25 ft bgs).

7.9.2 Verification Sampling

Verification sampling will be conducted in general accordance with 40CFR § 761.280-298 Subpart O "Sampling to Verity Completion of Self-Implementing Cleanup and on-site Disposal of Bulk PCB Remediation Waste and Porous Surfaces in Accordance with §761.61(a)(6)." Given the size of excavation is anticipated to be 90 sq. ft approximately four verification samples will be conducted utilizing a sampling grid with a maximum of 1.5 m (approximately 5 ft.) spacing, in accordance with 40 CFR 761.61 Subpart O. Approximate anticipated sample locations are shown on **Figure 4F** and **Table 4**.

Sampling will be completed per the December 2023 QAPP (QA#24013). One field equipment rinsate blank per non-dedicated piece of equipment, one duplicate building material sample per ten samples and one MS/MSD sample per twenty samples will be collected for QA/QC purposes. Sampling tools shall be decontaminated

between samples by first removing gross contamination, and then performing a final wipe using a clean hexane-wetted paper towel/rag. All samples shall be placed in laboratory-supplied jars and transported under chain-of-custody protocol to a certified laboratory for PCB analysis in accordance with the Method 3546 Microwave Extraction method and SW-846 8082 Aroclor analytical method.

7.9.3 Waste Management

Composite soil samples will be required by the disposal facility for waste characterization profiling purposes prior to their acceptance of the waste. This will be completed by Montrose who will collect one in-situ composite sample utilizing hand tools in the excavation area following the removal of overlying concrete/asphalt. Once it is confirmed that the soils contain < 50 mg/kg PCBs they will be considered non-hazardous and removed for disposal as Non-Hazardous PCB Remediation Waste. The Remedial Contractor shall "live-load" the contaminated soils into dump trucks and haul them directly to the off-Site disposal location under bill of lading.

7.9.4 Backfill

Once verification of the self-implementing cleanup is confirmed, the excavation will be backfilled and compacted with imported clean fill. The excavated areas would be backfilled to within 6 inches of surrounding grade with clean fill soil, sand borrow material comprised of VTrans Standard Spec 703.03 (or approved equal), from a known off-Site source for which the material has been confirmed to be non-impacted and to meet the criteria for unrestricted land use. As part of final Site work, the General Contractor will later import clean topsoil and seed to complete restoration of the excavated areas.

7.10 Decontamination Procedures

7.10.1 Field Sampling Equipment

Equipment decontamination is needed to prevent the potential or likelihood of cross-contamination during post-excavation verification sample collection. Field equipment falls into two categories: consumable and reusable. Consumable field equipment is dedicated equipment that is immediately disposed of once it is used. Consumable equipment is preferred and will be used to the maximum extent possible. Consumable equipment includes stainless steel trowels, scoopulas, drill bits and gloves used in sample collection for this project. The consumable equipment is exclusively used at a sample location/depth and then disposed in accordance with 40CFR § 761.61(a)(5)(v)(A) at facility permitted, licensed, or registered to manage municipal solid waste or nonmunicipal non-hazardous waste.

Reusable equipment, if needed, may consist of hand tools, shovels, etc. Equipment that is reused will be decontaminated between sampling locations. Dedicated sampling tools shall be decontaminated between samples Sampling equipment will be decontaminated with the double wash/rinse method as defined in 40 CFR 761 Subpart S. Sampling equipment will be decontaminated following the collection of each sample. The cleaning products will be used according to the manufacturer’s instructions. Use of a dedicated brush will be used for application of the product to reusable equipment. The equipment is then rinsed with de-ionized water.

7.10.2 Heavy Earthmoving Equipment

Prior to coming into contact with imported fill, or any other clean stone, and prior to leaving the Site, decontamination of heavy equipment that has come into contact with PCBs will be completed by the Remedial Contractor in accordance with 40 CFR § 761.7(C)"*Self-implementing decontamination procedures"*. The bucket, blade or other components shall first be decontaminated over a decontamination pad and shall be constructed of timbers and two layers of 8-mil polyethylene sheeting. Decontamination procedures shall include use of a pressure washer, followed by two rounds of spraying a solvent (such as diesel fuel or hexane) and hand wiping each application with disposal rags using the double wash/rinse method as defined in 40CFR § 761 Subpart S "*Double wash/Rinse Method for Decontamination Non-Porous Surfaces*". Wash fluids shall be collected and transferred to a 55-gallon drum for disposal in accordance with **Section 7.11**.

When decontamination is deemed complete Montrose will collect a verification wipe sample of the equipment and submit for laboratory analyses. The laboratory will be requested to provide a two-three business-day turnaround time to report the results. If results indicate residual PCB concentrations are above 10 ug/100 cm^2 on the equipment, the Remedial Contractor will be required to repeat the decontamination procedures above, followed by a second wipe sample verification by Montrose for laboratory analysis. No heavy equipment will be allowed to leave the Site without approval by Montrose.

7.10.3 Disposal of Decontamination Cleaning Liquids or Rinsates

Disposal of solvents, cleaners, and absorbent materials shall be done so in accordance with 40CFR § 761.79(g) *"Decontamination waste and residues".* Decontamination materials will be classified into the same waste stream as the material it last encountered. When in doubt, decontamination materials will be classified as Hazardous Bulk PCB Remediation Waste.

Liquid PCB remediation waste may be temporarily stored on-site in a water tight container such as a 55-gallon drum, caged Immediate Bulk Container (IBC) tote tank, frac tank, etc. and labeled accordingly during temporary on-site storage. Prior to off-site transportation and disposal, liquid samples will be collected in accordance with the requirements of a facility approved to dispose liquid PCB remediation waste. The Remedial Contractor will assist Montrose in obtaining samples for waste characterization, submitting them for laboratory analyses, and obtaining facility approval for transportation and disposal.

7.11 PCB Waste Disposal

PCB remediation waste will be disposed of off-Site in accordance with 40 CFR 761.61(a)(5).

Paint chips and associated particulates/dust will be disposed as PCB Remediation Waste with a PCB concentration ≥50 ppm which exhibit the TCLP characteristic for lead shall be disposed of in a hazardous waste landfill permitted by EPA under section 3004 of RCRA, or by a State authorized under section 3006 of RCRA, and a PCB disposal facility approved under 40 CFR 761.61. Disposal for this waste has been vetted and approved at the Waste Management RCRA/TSCA permitted facility in Emelle, Alabama.

Building materials (concrete, wood, plaster and other materials) with adhered paint exhibiting total PCB concentrations ≥50 ppm will be disposed as Solid PCB Bulk Product Waste. This material will be removed for off-Site disposal at a permitted hazardous waste disposal facility by permitted hazardous waste haulers in accordance

with 40 CFR 761.61(a)(5)(i)(B)(2)(iii). Wastes with PCB concentrations > 50 ppm are regulated as hazardous wastes by the state of Vermont and are required to be shipped under manifest to a RCRA Subtitle C permitted TSDF. Disposal for this waste has been vetted and approved at the Waste Management RCRA/TSCA permitted facility in Emelle, Alabama.

Building materials and soils will be disposed as Solid Non-Hazardous Bulk PCB Remediation Waste has a total PCB concentration >1 ppm and <50 ppm. This material will be removed for off-Site disposal at an appropriate facility that is permitted, licensed, or registered by a State to manage non-municipal non-hazardous waste and is permitted to accept PCBs by permitted, non-hazardous waste haulers, in accordance with 40 CFR 761.61(a)(5)(i)(B)(2)(ii) and 40 CFR 761.61(a)(5)(v)(A). It is proposed to dispose of this waste at the Coventry Landfill which is a local facility owned by Casella.

Disposal of liquid PCB waste from decontamination shall be done so in accordance with 40CFR § 761.79(g) *"Decontamination waste and residues".* Decontamination materials will be classified as Hazardous Bulk PCB Remediation Waste. Liquid non-PCB remediation waste that meets the decontamination standard listed in 40 CFR 761.79(b) will either be pumped to the local sewer following permit and approval from the Town of St. Johnsbury, or shipped to an appropriate disposal facility. The Remedial Contractor would obtain the sewer disposal permit, if needed.

Non-liquid cleaning materials and PPE, such as rags, gloves, booties, other disposable PPE, and similar materials will be disposed of in accordance with 40 CFR 761.61(a)(5)(v)(A) as Solid Non-Hazardous Bulk PCB Remediation Waste.

Applicable disposal paperwork will be kept on file and submitted in a final report. This includes the following types of documents:

- Notification of PCB Activity (Form 7710-53);
- Generator Waste Profiles;
- Disposal facility waste approval letters;
- Manifests for transportation of hazardous waste;
- Bills of Lading for transportation of non-hazardous waste;
- Certificates of Disposal for disposal of hazardous waste; and
- Weight tickets for disposal of non-hazardous waste.

7.12 Contingency Plan

A deviation from the Work Plan may be required should unexpected conditions be encountered. The following contingency plans have been developed if the situation is encountered during work.

- Verification sampling of building materials demonstrate PCB concentrations remain greater than 1 ppm in wood floor joists on the 2nd floor. Given the structural necessity of the floor joists it is not feasible that they be removed. Should this condition be encountered a two-layer epoxy coating shall be applied to the wood floor joists. For wood, it is proposed that ELASTO-GRIP® FC 151-1051 (or similar) which is a waterborne polyamine epoxy be used as follows (product information included in **Appendix F**):

- Prior to application a leveling compound will be used as needed and allowed to fully cure.
- Rough areas of the wood will be sanded, and debris will be cleaned with a with HEPA vacuum. All surfaces must be clean, dry and free of oil and grease prior to application.
- Two 1-millimeter coats will be applied in accordance with the manufacturer's directions. An additional deed restriction will need to be applied which requires future owners to maintain this coating.

Pre-occupancy indoor air testing for PCBs shall be conducted if this condition is encountered. Additionally, the long-term monitoring and mitigation plan discussed in **Section 8** will require should this condition be encountered additional annual indoor air monitoring on the 2nd floor of the building.

- Paint seepage through flooring onto joists on the 1st floor. If there is visible paint on the floor joists paint will be chiseled out to a maximum depth of 1/4 inches. Debris will be cleaned with a HEPA vacuum followed by a pressure washer (minimized water volume used) and wet vac. Chiseled areas will be filled with a leveling course. If visible paint remaining after 1/4 inches is removed a sample will be collected. If the sample results indicated a concentration above 1 ppm then a two-layer epoxy coating shall be applied to the wood floor joists using the procedure described in the above bullet.
- Concealed regulated buildings materials not previously known. Work will cease in the area of the previously untested materials, the materials will be tested and managed accordingly;
- Unexpected subsurface conditions are encountered including previously undetected structures or soil characteristics. This will be evaluated on a case by case at the time of work.
- Verification endpoint soil sampling reveals a greater extent of impact than expected. Should PCB-impacted soils with concentrations greater than 1.0 ppm be encountered or distributed in a wider area than anticipated following initial verification sampling, the excavation will be advanced until verification sampling results demonstrate that cleanup activities have been successful and remaining PCB concentrations are below 1.0 ppm. Additional excavation of PCB-impacted soil with concentrations greater than 1.0 ppm will be excavated and disposed of in accordance with **Section 7.9**.

Additional unexpected conditions, if any, will be reported to the Town of St. Johnsbury, VTDEC and EPA's Brownfield Project Officer immediately and a proposed deviation to the Work Plan will be submitted for approval as soon as possible. The proposed deviation plan will include details of the proposed changes and its effect on the overall remedy.

8 LONG TERM MONITORING AND MAINTENANCE

Following completion of the PCB remediation, a Long-Term Monitoring and Maintenance Plan will be developed to describe communication, monitoring and maintenance of residual PCB impacted foundation and building walls and any other surface where PCBs > 1 ppm remain under encapsulation. The plan will go into effect prior to building occupancy. The plan will remain in effect and monitoring shall continue until such time that EPA and VTDEC approves in writing that monitoring and maintenance activities are no longer required. Elements of the plan will include:

- Roles and responsibilities;
- Communication;
- Qualifications and Training;
- Inspection Protocol. The first inspection event will occur following construction, but before building occupancy;
- Indoor Air Sampling Methods and Action Levels per VTDEC's Indoor Air Testing for PCBs in Non-School Buildings Technical Guidance, 2022. The first indoor air sampling event will occur following construction, but before building occupancy;
- Reporting and Record Keeping; and
- Corrective Measures.

The plan will include requirements for annual indoor air sampling for PCBs and annual inspection of the encapsulant by an Environmental Professional. An annual report detailing the inspection, monitoring, repairs and changes to building operations will be provided to EPA and VTDEC.

A deed restriction will be applied with language that all current and future owners follow the Long-Term Monitoring and Maintenance Plan.

9 PROJECT SCHEDULE

The proposed project scheduled is included as **Appendix A.** If there are changes to the schedule, the following project participants will be notified via electronic mail:

- The Town of St. Johnsbury, or future property owner(s);
- EPA Project Officer; and
- VTDEC Project Manager.

10 CERTIFICATION

This PCB Cleanup Work Plan for the Site located at 1249 Main Street, St. Johnsbury, Vermont is owned by the Town of St. Johnsbury. This PCB Cleanup Work Plan includes self-implementing and risk-based cleanup and disposal approach which will be implement under the supervision of Montrose Environmental Solutions, Inc. The sampling plans, sample collection procedures, sample preparation procedures, extraction procedures, and instrumental/chemical analysis procedures used to assess or characterize the PCB contamination at the cleanup site, are on file at the Town of St. Johnsbury, 51 Depot Square, Suite 3, St. Johnsbury, VT 05819, and are available for EPA inspection (§ 761.61(a)(3)(i)(E)).

Notes:
All results reported in micrograms per liter (ug/L), or parts per million (ppm)
"-" - Indicates that the Total PCBs result for a given sample were non-detect
<(Number) - Result was not detected above the reported MDL
MDL - Method Detection Limit - the lowest quantitative threshold
Detection limits displayed are elevated in response to a lower intial volume used for analysis.

PCB SAMPLE RESULTS - AUGUST 14 - DECEMBER 3, 2023

Notes:
All results reported in micrograms per liter (ug/L), or parts per million (ppm)
'-' - Indicates that the Total PCBs result for a given sample were non-detect
<(Number) - Result was not detected above the reported MDL
MDL - Method Detection Limit - the lowest quantitative threshold
Detection limits displayed are elevated in response to a lower initial volume used for analysis

Notes:
All results reported in micrograms per liter (ug/L), or parts per million (ppm)
'-' - Indicates that the Total PCBs result for a given sample were non-detect
<(Number) - Result was not detected above the reported MDL
MDL - Method Detection Limit - the lowest quantitative threshold
Detection limits displayed are elevated in response to a lower initial volume used for analysis.

Notes:
All results reported in micrograms per liter (ug/L), or parts per million (ppm)
'-' - Indicates that the Total PCBs result for a given sample were non-detect
<(Number) - Result was not detected above the reported MDL
MDL - Method Detection Limit - the lowest quantitative threshold
Detection limits displayed are elevated in response to a lower initial volume used for analysis.

9	Interior	Wall Paint	Light blue	P-5	22	-

DEMOLITION KEY SCHEDULE

KEY	DESCRIPTION
2A	DEMO EXTERIOR BRICK MASONRY WALL
2B	DEMO INTERIOR WALL PARTITION. PATCH AND REPAIR FLOOR AND CEILING FOR NEW CONSTRUCTION.
2C	DEMO SITE WALL TO EXTENT SHOWN ON PLAN
2D	DEMO INTERIOR MASONRY WALL TO EXTENT SHOWN. INSTALL NEW STEEL LINTEL AT OPENING HEAD. PATCH AND REPAIR FLOOR AND CEILING FOR NEW CONSTRUCTION.
5A	DEMO EXTERIOR DOOR AND FRAME
5B	DEMO EXTERIOR WINDOW AND FRAME
5C	DEMO INTERIOR DOOR AND FRAME
5D	DEMO EXTERIOR WINDOW AND PREP FOR WINDOW REPLACEMENT
4A	REMOVE EXTERIOR CONCRETE STAIR AND RAILINGS
4B	REMOVE MILLWORK COUNTER
4C	REMOVE EXISTING WOOD RAILING
4D	REMOVE EXISTING SHED ROOF AND ALL SUPPORTS
4E	DEMO EXISTING CONCRETE RAMP
4F	REMOVE EXISTING TOILET PARTITIONS. PATCH AND REPAIR WALL / FLOOR ATTACHEMENT
4G	REMOVE EXISTING WOOD STAIR AND RAILINGS.
5A	REMOVE SINK, CAP PLUMBING IN WALL, COVER WITH S.S. PLATE
5B	REMOVE WALL HUNG URINAL, CAP PLUMBING BEHIND WALL, CAP WITH S.S. PLATE
5C	REMOVE FLOOR MOUNT TOILET

GENERAL DEMOLITION NOTES

1. ALL WALL AND DOOR FRAMING THAT IS EXISTING TO REMAIN WILL NEED TO HAVE HEADERS AND SILL PLATES REFRAMED TO COORDINATE WITH THE NEW CONCRETE SLAB.

LEGEND

PCBs ≥ 50.0 PPM (REMOVE PAINT WITH SUBSTRATE, DISPOSE AS PCB BULK PRODUCT WASTE)

PCBs ≥ 1.0 PPM AND <50.0 PPM (REMOVE PAINT WITH SUBSTRATE, DISPOSE AS NON-HAZARDOUS PCB REMEDIATION WASTE)

1 FLOOR PLAN - SECOND FLOOR
(1 D1.03) 3/16" = 1'-0"

NOTES
1. DRAWING BASED ON WIEMANN LAMPHERE DEMOLITION PLAN - LEVEL 2 D1.03 DATED 12/1/2023
2. ALL LOCATIONS SHOWN ARE APPROXIMATE.
3. CONTRACTOR SHALL SCRAPE ALL LOOSE AND PEALING PAINT FROM ALL SURFACES AND SHOP VAC FLOOR PRIOR TO STARTING REMEDIATION ON A RESPECTIVE FLOOR.
4. CONTRACTOR SHALL WET A RESPECTIVE AREA PRIOR TO REMOVAL TO MINIMIZE DUST.
5. CONTRACTOR TO REMOVE AND DISPOSE OF ALL UNIVERSAL WASTES AS PART OF WORK.
6. CONTRACTOR TO REMOVE ANY VISIBLE PAINT VIA DRY-ICE BLASTING (OR APPROVED EQUAL) FROM ANY CONCRETE OR MASONRY WALLS DESIGNATED TO REMAIN AND APPLY TWO COATS OF ENCAPSULANT.

Notes:
All results reported in micrograms per liter (ug/L), or parts per million (ppm)
"U" - indicates that the Total PCBs result for a given sample were non-detect
"-(number)" - Result was not detected above the reported MDL
MDL - Method Detection Limit - the lowest quantitative threshold
Detection limits displayed are elevated in response to a lower initial volume used for analysis.

1 DEMOLITION PLAN - LEVEL 1
D1.02 3/16" = 1'-0"

GENERAL DEMOLITION NOTES

1. ALL WALL AND DOOR FRAMING THAT IS EXISTING TO REMAIN WILL NEED TO HAVE HEADERS AND SILL PLATES REFRAMED TO COORDINATE WITH THE NEW CONCRETE SLAB.

DEMOLITION KEY SCHEDULE

KEY	DESCRIPTION
2A	DEMO EXTERIOR BRICK MASONRY WALL
2B	DEMO INTERIOR WALL PARTITION. PATCH AND REPAIR FLOOR AND CEILING FOR NEW CONSTRUCTION.
2C	DEMO SITE WALL TO EXTENT SHOWN ON PLAN
2D	DEMO INTERIOR MASONRY WALL TO EXTENT SHOWN. INSTALL NEW STEEL LINTEL AT OPENING HEAD. PATCH AND REPAIR FLOOR AND CEILING FOR NEW CONSTRUCTION.
3A	DEMO EXTERIOR DOOR AND FRAME
3B	DEMO EXTERIOR WINDOW AND FRAME
3C	DEMO INTERIOR DOOR AND FRAME
3D	DEMO EXTERIOR WINDOW AND PREP FOR WINDOW REPLACEMENT
4A	REMOVE EXTERIOR CONCRETE STAIR AND RAILINGS
4B	REMOVE MILLWORK COUNTER
4C	REMOVE EXISTING WOOD RAILING
4D	REMOVE EXISTING SHED ROOF AND ALL SUPPORTS
4E	DEMO EXISTING CONCRETE RAMP
4F	REMOVE EXISTING TOILET PARTITIONS. PATCH AND REPAIR WALL / FLOOR ATTACHEMENT
4G	REMOVE EXISTING WOOD STAIR AND RAILINGS.
5A	REMOVE SINK, CAP PLUMBING IN WALL, COVER WITH S.S. PLATE
5B	REMOVE WALL HUNG URINAL, CAP PLUMBING BEHIND WALL, CAP WITH S.S. PLATE
5C	REMOVE FLOOR MOUNT TOILET

HISTORIC PCB SAMPLE RESULTS

Sample Location / Room	Exterior/ Interior	Sampled Material	Description / Notes	Sample ID	Total PCBs (ppm)	Sample Location Unknown
Gym / 17, South Side	Interior	Wall Paint	White	19A	7.4	-
	Interior			19B	7.4	-
	Interior			PCB-19C	9	-
Gym / 17	Interior	Paper Under Flooring	Unknown	P-1	4.4	-
16	Interior	Paper Under Flooring	Unknown	P-3	7.8	-

NOTES
1. DRAWING BASED ON WIEMANN LAMPHERE DEMOLITION PLAN - LEVEL 1 D1.02 DATED 12/1/2023
2. ALL LOCATIONS SHOWN ARE APPROXIMATE.
3. CONTRACTOR SHALL SCRAPE ALL LOOSE AND PEALING PAINT FROM ALL SURFACES AND SHOP VAC FLOOR PRIOR TO STARTING REMEDIATION ON A RESPECTIVE FLOOR.
4. CONTRACTOR SHALL WET A RESPECTIVE AREA PRIOR TO REMOVAL TO MINIMIZE DUST.
5. CONTRACTOR TO REMOVE AND DISPOSE OF ALL UNIVERSAL WASTES AS PART OF WORK.
6. CONTRACTOR TO REMOVE ANY VISIBLE PAINT VIA DRY-ICE BLASTING (OR APPROVED EQUAL) FROM ANY CONCRETE OR MASONRY WALLS DESIGNATED TO REMAIN AND APPLY TWO COATS OF ENCAPSULANT.

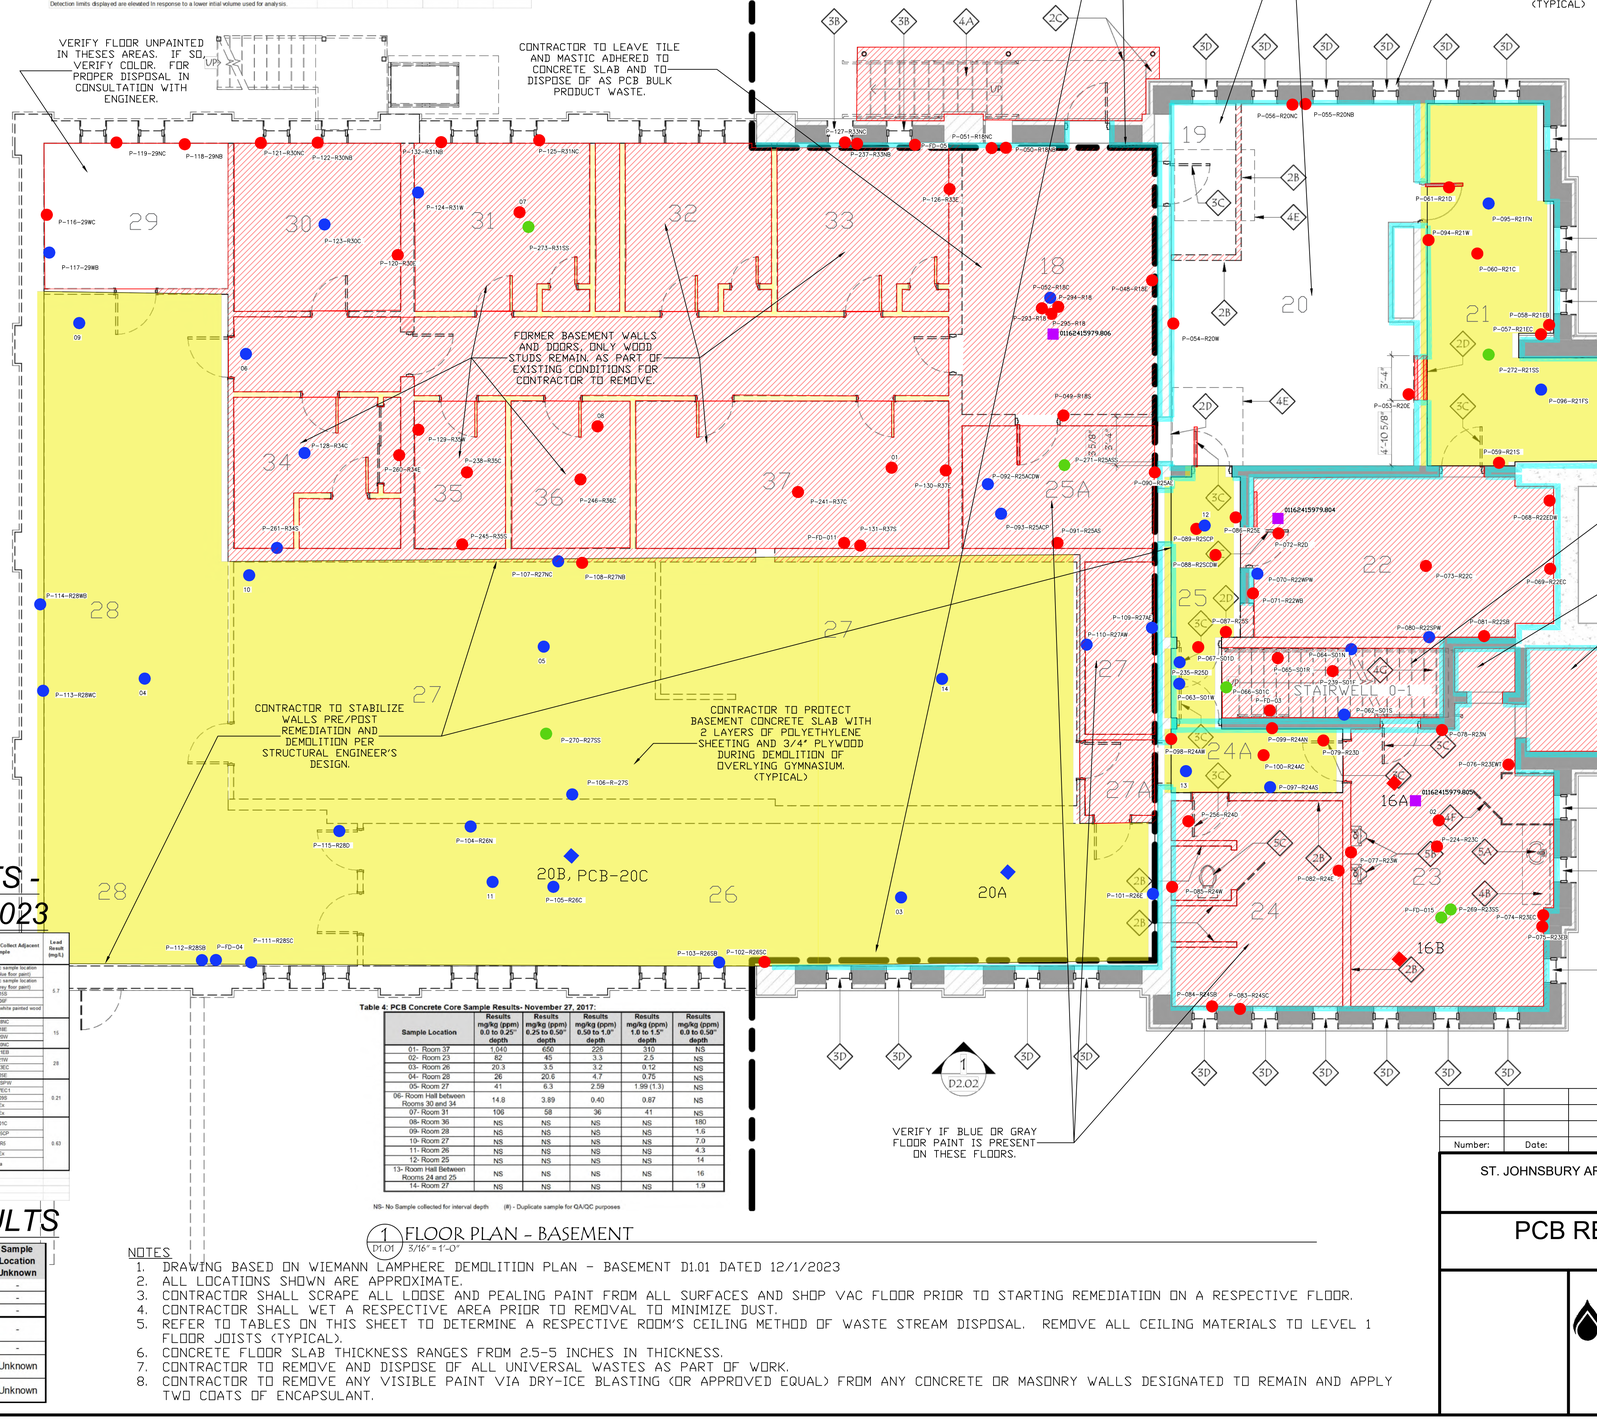
Notes:
All results reported in micrograms per liter (ug/L), or parts per million (ppm)
"-" - Indicates that the Total PCBs result for a given sample were non-detect
<(Number) - Result was not detected above the reported MDL
MDL - Method Detection Limit - the lowest quantitative threshold
Detection limits displayed are elevated in response to a lower initial volume used for analysis.



TCLP LEAD SAMPLE RESULTS - AUGUST 14 - DECEMBER 3 2023

Waste Characterization Composite Sample Identification	Exterior/Interior	Floor	Room	Direction	Substrate	Color	Former Sample ID to Collect Adjacent Sample	Lead Result (mg/L)

Material IDs and Room numbers from Atlas Technical Consultants *Workplan for Additional Hazardous Building Materials Sampling*, 2023
mg/L = milligrams per liter

HISTORIC PCB SAMPLE RESULTS

Sample Location / Room	Exterior/ Interior	Substrate	Description / Notes	Sample ID	Total PCBs (ppm)	Sample Location Unknown
26	Interior	Floor Paint	Blue	20A	27	-
26	Interior			20B	44	-
Unknown	Interior			PCB-20C	67	-
23	Interior	Floor Paint	Grey	16A	5700	-
23	Interior			16B	4800	-
Unknown	Interior			16C	5700	Unknown
Unknown	Interior			PCB-16D	20000	Unknown

KEY	DESCRIPTION
2A	DEMO EXTERIOR BRICK MASONRY WALL
2B	DEMO INTERIOR WALL PARTITION. PATCH AND REPAIR FLOOR AND CEILING FOR NEW CONSTRUCTION.
2C	DEMO SITE WALL TO EXTENT SHOWN ON PLAN
2D	DEMO INTERIOR MASONRY WALL TO EXTENT SHOWN. INSTALL NEW STEEL LINTEL AT OPENING HEAD. PATCH AND REPAIR FLOOR AND CEILING FOR NEW CONSTRUCTION.
3A	DEMO EXTERIOR DOOR AND FRAME
3B	DEMO EXTERIOR WINDOW AND FRAME
3C	DEMO INTERIOR DOOR AND FRAME
3D	DEMO EXTERIOR WINDOW AND PREP FOR WINDOW REPLACEMENT
4A	REMOVE EXTERIOR CONCRETE STAIR AND RAILINGS
4B	REMOVE MILLWORK COUNTER
4C	REMOVE EXISTING WOOD RAILING
4D	REMOVE EXISTING SHED ROOF AND ALL SUPPORTS
4E	DEMO EXISTING CONCRETE RAMP
4F	REMOVE EXISTING TOILET PARTITIONS. PATCH AND REPAIR WALL / FLOOR ATTACHEMENT
4G	REMOVE EXISTING WOOD STAIR AND RAILINGS.
5A	REMOVE SINK, CAP PLUMBING IN WALL, COVER WITH S.S. PLATE
5B	REMOVE WALL HUNG URINAL, CAP PLUMBING BEHIND WALL, CAP WITH S.S. PLATE
5C	REMOVE FLOOR MOUNT TOILET

GENERAL DEMOLITION NOTES

1. ALL WALL AND DOOR FRAMING THAT IS EXISTING TO REMAIN WILL NEED TO HAVE HEADERS AND SILL PLATES REFRAMED TO COORDINATE WITH THE NEW CONCRETE SLAB.

Table 4: PCB Concrete Core Sample Results- November 27, 2017:

NS- No Sample collected for interval depth (R) - Duplicate sample for QA/QC purposes

1 D1.01 FLOOR PLAN - BASEMENT 3/16" = 1'-0"

NOTES
1. DRAWING BASED ON WIEMANN LAMPHERE DEMOLITION PLAN - BASEMENT D1.01 DATED 12/1/2023
2. ALL LOCATIONS SHOWN ARE APPROXIMATE.
3. CONTRACTOR SHALL SCRAPE ALL LOOSE AND PEALING PAINT FROM ALL SURFACES AND SHOP VAC FLOOR PRIOR TO STARTING REMEDIATION ON A RESPECTIVE FLOOR.
4. CONTRACTOR SHALL WET A RESPECTIVE AREA PRIOR TO REMOVAL TO MINIMIZE DUST.
5. REFER TO TABLES ON THIS SHEET TO DETERMINE A RESPECTIVE ROOM'S CEILING METHOD OF WASTE STREAM DISPOSAL. REMOVE ALL CEILING MATERIALS TO LEVEL 1 FLOOR JOISTS (TYPICAL).
6. CONCRETE FLOOR SLAB THICKNESS RANGES FROM 2.5-5 INCHES IN THICKNESS.
7. CONTRACTOR TO REMOVE AND DISPOSE OF ALL UNIVERSAL WASTES AS PART OF WORK.
8. CONTRACTOR TO REMOVE ANY VISIBLE PAINT VIA DRY-ICE BLASTING (OR APPROVED EQUAL) FROM ANY CONCRETE OR MASONRY WALLS DESIGNATED TO REMAIN AND APPLY TWO COATS OF ENCAPSULANT.

Notes:
Adapted From the Following Historical Reference(s):
PCB Building Materials Survey , ATC Group Services LLC, 3-Mar-17
FD = Field Duplicate Sample Collected for QA/QC
R = Room Number
NS = No Sample Collected For Interval Depth
All results reported in parts per million (ppm)
Tan shading indicates a PCB concentration greater than 50 ppm.

Notes:
Adapted From the Following Historical Reference(s):
Targeted Brownfields Assessment: Hazardous Building Materials, KGSNE, 9-Mar-21
Environmental Survey, Cardno ATC, 28-Mar-13
'--' = Indicates the results for that sample were non-detect
Orange shading indicates a positive result for the sampled material.
Positive ACM samples in the Cardno ATC Environmental Survey Report identified as bearing "trace" quantities of asbestos were identified as "<1%".

Notes:
Adapted From the Following Historical Reference(s):
Site Investigation Report, Atlas Technical Consultants LLC, 11-Oct-22
All results reported in ppm
Bold values indicate detections.
NE = Not Encountered
VSS = Vermont Soil Standards (IRULE, July 2019)
TEF = Toxicity Equivalent Factor
TEQ = Toxicity Equivalent Quotient
BaP TEQ values were calculated from select PAH analytical concentrations
as shown multiplied by the corresponding TEF and summed TEF compounds
that are non-detect were estimated based on half of the provided laboratory limit.
BaP TEQ values are compared to VSS for Residential Soils and
Urban Background values.
Green shaded values are below Residential Values.
Blue Shaded values indicate exceedance of Residential Values.
Orange shaded values indicate exceedance of Urban Background Values.
Red shaded values indicate exceedance of Non-Residential Values.
NS = Not Standard Available
NA = Not Analyzed
J = Estimated Value Below Laboratory Reporting Limit (RL)
fbgs = feet blow ground surface
RPD = Relative Percent Difference

Notes:
Adapted from Target Brownfields Assessment Hazardous Building Materials Assessment, KGSNE, 10-Jan-24
Material IDs and Room numbers from Atlas Technical Consultants *Workplan for Additional Hazardous Building Materials Sampling* , 2023
LF = linear feet
SF = square feet
'--' = indicates all results for that sample were non-detect.
All results reported in ppm
J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the samples.
Red shading indicates the material did not exist
Tan shading indicates the material contains a total PCB concentration over 50 ppm
Gray shading indicates the material was not selected to be sampled in the original sample plan by Atlas. The materials are still shown in the Atlas Workplan tables and were carried over for continuity.

Table 2B
PCB Bulk Material Sample Results
2023 Targeted Brownfield Analysis
St. Johnsbury Armory
St. Johnsbury, VT

KGSNE Sample ID	Material Type / Material ID	Material Description	Material Location	Quantity of Material	Location(s) of Samples	Arolclor 1016	Aroclor 1221	Aroclor 1232	Aroclor 1242	Aroclor 1248	Aroclor 1254	Aroclor 1260	Aroclor 1262	Aroclor 1268	Total Aroclors
	Caulk / #1	Caulk bead – characteristics unknown	Exterior - Between back edge of soffit and brick wall; north and south sides of building; a portion is hanging down on north side	70 LF	North side of building										
				70 LF	South side of building										
P-275-Ex	Caulk / #2	White	Exterior – Roofline intersection (sloping portion) between east and west portions of building, at top of metal flashing and in joint between roof and wall.	30 LF	North side of building	<0.70	<0.70	<0.70	<0.70	<0.70	5.9	<0.70	<0.70	<0.70	5.9

Notes:
Adapted from Target Brownfields Assessment Hazardous Building Materials Assessment, KGSNE, 10-Jan-24
All results reported in ppm
The intervals at the end of the KGSNE Sample ID correspond to the depth interval, in feet (eg 000.5 corresponds to 0-0.5 interval)
J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the samples.

Notes:
Adapted from Target Brownfields Assessment Hazardous Building Materials Assessment, KGSNE, 10-Jan-24
1. Sample was labeled A-019a-R23 in the field but was collected from Room 32.
Material IDs and Room numbers from Atlas Technical Consultants *Workplan for Additional Hazardous Building Materials Sampling*, 2023
LF = linear feet
SF = square feet
'--' = indicates the results for that sample were non-detect.
Red shading indicates the material did not exist

Notes:
All results reported in micrograms per liter (ug/L)
'--' - Indicates that the Total PCBs result for a given sample were non-detect
<(Number) - Result was not detected above the reported MDL
MDL - Method Detection Limit - the lowest quantitative threshold
Detection limits displayed are elevated In response to a lower intial volume used for analysis.

	Stairwell	SW-1-Pl	Plaster	Plaster on stairwell wall near prior sample P-064-S01S
Quality Control Samples				
		FD-XX	Field Duplicate	One per 10 samples per matrix
		same as parent	MS/MSD	One per 20 samples per matrix
		EB-XX	Equipment Blank	One sample per piece of non-dedicated sampling equipment used

Notes

Br = Brick

C = Concrete

MS/MSD = Matrix Spike/Matrix Spike Duplicate

PCBs = Polychlorinated Biphenyls

Pl = Plaster

1. Samples will be submitted for PCB analysis utilizing extraction method 3546 determinative method 8082A
2. Wall samples shall be collected approximately mid-way between floor and ceiling

Table 4 Sample Design - PCB Excavation Verification Samples
St. Johnsbury Armory Redevelopment Project
1249 Main Street
St. Johnsbury, Vermont

Location / Sample ID[1]	Estimated Sample Location Depth (ft bgs)	Matrix	Rationale	Laboratory Analysis
				PCBs (8082)
C-1-S	1.5	Soil	Evaluate soil conditions in former boiler room	1
C-2-S	1.5	Soil	Evaluate subslab soil conditions near floor drain	1
C-3-S	1.5	Soil	Evaluate subslab soil conditions near floor drain	1
Quality Control Samples				
FD-01		Soil	Field Duplicate	1
same as parent		Soil	MS/MSD	1
EB-01		Water	Equipment Blank	See Note 2

Notes

ft bgs = feet below ground surface

C = Excavation Area C

MS/MSD = Matrix Spike/Matrix Spike Duplicate

PCBs = Polychlorinated Biphenyls

S = Soil

1. Sample locations subject to change based on site conditions

2. Sample will be collected for each piece of non-dedicated sampling equipment used

ASSUMPTIONS:

Schedule assumes estimated Town and Agency review timeframes as indicated.

Schedule assumes one round of Town and Agency review comments will be required for all Deliverables to be issued as final.

Remediation Timeframe of three months is for informational purposes and is contingent upon Contractor's construction schedule to be submitted at the time of bidding.

1.0 BACKGROUND

The following report documents the asbestos, polychlorinated biphenyls (PCBs), lead based paint (LBP), lead in dust, indoor air quality (IAQ), drain sediment sampling performed at the former Saint Johnsbury Armory facility, located at 1249 Main Street (the site) in Saint Johnsbury, Vermont. In addition the report documents the dye-testing results of the basement floor drain system.

The site is currently developed with the former St. Johnsbury Armory building, a three story masonry structure. The building is currently vacant and is located on an approximately 0.44 acre parcel. The property is located in downtown St. Johnsbury in an area with mix-use development. The property is located on the west side of Main Street and is bounded on the north and west by the Saint Andrews Episcopal Church and the Grace Methodist Church, respectively; a dentist's office to the south and to the east, across Main Street is the Passumpsic Savings Bank and several other small business'.

Pursuant to the Phase I Environmental Site Assessment (May 2012, the Johnson Company), the property has been developed since at least 1882, originally with four separate buildings. Apparently the current armory building was constructed circa 1916. Modern uses of the building include use by the St, Johnsbury Police Department, the American Red Cross and the St. Johnsbury Parks and recreation Department. The Phase I indicates that the Vermont National Guard last occupied the building in 1976.

Cardno ATC understands that the Saint Johnsbury History and Heritage Center is assessing the feasibility for redevelopment of the building into a possible office headquarters, education and museum space.

This US EPA Brownfields project was completed by Cardno ATC for the Northeastern Vermont Development Association (NVDA) and pursuant to the approved Site Specific Quality Assurance Project Plan (SSQAPP) Addenda F-1 dated November 28, 2012. The Scope of Work for this project as outlined in the SSQAPP was based on the findings of the Phase I Environmental Site Assessment completed for the site in May of 2012 (prepared by the Johnson Company).

2.0 FINDINGS

2.1 ASBESTOS SURVEY

Pursuant to the SSQAPP, all asbestos samples were collected pursuant to the Cardno ATC SOP F-SOP-1.12. This *baseline* asbestos survey was also conducted pursuant to ASTM method E2356-04 "Standard Practice for Comprehensive Building Asbestos Surveys". Samples were submitted to the Cardno ATC Asbestos Laboratory Division (NY, NY) for laboratory analysis via polarized light microscopy (PLM) analysis.

A *Baseline Survey* is a building-wide or facility wide inspection that provides a general sense of the overall location, type, quantity and conditions of asbestos –containing materials (ACM) present. The baseline survey provides information for long-term management of ACM and prioritization of response actions, however a baseline survey is unobtrusive in that walls and other barriers are not damaged (opened up) in order to collect samples. Therefore, it is possible that suspect ACM may be located behind walls other barriers (such as inside boilers, doors, etc.).

Previous asbestos sampling data from Crothers Environmental Group LLC's "Limited Interior Asbestos Inspection" report Dated November 1, 2008 was utilized and sampling data from the 2008 report was incorporated into this report. The fieldwork was conducted by Cardno ATC on December 10, 17, 18 and 28, 2012.

Asbestos bulk samples were analyzed by Polarized Light Microscopy (PLM). Asbestos Containing Material (ACM) is defined as material that contains any type of asbestos in an amount greater than 1% asbestos.

The following building materials were identified as ACM from this survey:

- **Air cell pipe insulation (Homogenous Material No. 24 [H 24])**
- **Mudded joint packings (H42)**

The following materials were found to previously be identified as ACM within the previous 2008 survey:

- **Plaster walls and ceilings (H11)**

The following materials have not been sampled (due to inaccessibility) and should be assumed to be ACM:

- **Door Insulation (H15)**
- **Fire Brick (H26)**
- **Vibration Cloth (H34)**
- **Boiler Door Insulation (H37)**
- **Boiler Internal Materials (H43)**

The following materials were found to contain trace amounts (<1%) of asbestos:

- **Exterior Window Caulking (H4)**
- **Exterior Tar Brick Caulking (H5)**

Appendix A of this report contains a listing of suspect asbestos containing materials, a sample location diagram and the asbestos laboratory hardcopy results.

2.1.1 Asbestos Quality Assurance/Quality Control

For the purposes of comparing duplicate samples, samples 01A and 01B (duplicate) were utilized. Both samples were below were below laboratory detection limits. Laboratory in-house QA/QC included duplicate analysis of 10% of samples by the original analyst as well as a duplicate analysis by a second analyst (recounts). All QA/QC laboratory recounts passed QA/QC requirements; the Data Entry sheet for the asbestos bulk sample laboratory recounts is included with the laboratory hardcopy results in **Appendix A**.

2.1.2 Asbestos Recommendations

- Prior to any renovations/demolition to the building, any asbestos containing materials that may be disturbed must be removed or abated as required (per State and Federal regulations).

- Suspect ACM may be enclosed or concealed in areas Cardno ATC did not access during this survey. If suspect materials that are not included in this survey are discovered during renovation / demolition activities, they shall be tested prior to disturbance.

- Materials containing “trace” amounts of asbestos (<1%) are not considered Asbestos Containing Materials (ACM) by the US EPA and many state agencies. However, certain sections of OSHA standard 29 CFR 1926.1101 apply when such materials are subject to disturbance. Refer to “OSHA Standard Interpretation and Compliance Letter” dated 8/13/1999, subject: “Requirements for demolition operations involving material containing <1% asbestos”.

- Asbestos abatement activities must be performed by a Vermont certified abatement contractor following all applicable State and Federal regulations. Abatement activities should be designed by a Vermont certified asbestos project designer and overseen by a Vermont certified asbestos project monitor.

2.2 PCB IN BUILDING MATERIALS SURVEY

Pursuant to the SSQAPP, all PCB samples were collected pursuant to the Cardno ATC SOP F-SOP-1.17. Samples were submitted to EMSL Analytical, Inc. (Cinnaminson, NJ) for laboratory analysis via 3540C/8082A analysis. PCB bulk samples of suspect materials (oil paints, caulking or similar elastic sealant materials installed prior to 1978) were collected; a minimum of two bulk samples representative of each different homogeneous area of suspect material sampled were collected.

Cardno ATC visually inspected accessible areas of the facility for homogeneous groupings of suspect PCB containing materials. Only suspect (window and door caulking, paint, expansion joints etc.) materials installed prior to 1978 were investigated. Cardno ATC sampled ten (10) materials that are considered to be suspect for containing PCB's.

The EPA regulatory limit ("not authorized for use" under the Toxic Substances Control Act of 1976 [TSCA]) for PCBs in building materials is 50 parts per million (ppm).

The gray floor paint in the basement level (H16) was the only material identified during this survey as containing levels of PCBs in excess of 50 ppm. The PCB content of the gray paint was identified as containing levels up to 5,700 ppm.

Appendix B of this report contains a listing of suspect PCB materials, a PCB sample location diagram and PCB laboratory hardcopy results.

2.2.1 PCB Quality Assurance/Quality Control

Pursuant to the SSQAPP one duplicate PCB sample was collected. Sample number 16C (grey floor paint, H16) is a duplicate of sample number 16B (as well as 16A). The Relative Percent Difference (RPD) between samples 16B (5,600 ppm) and 16C (4,600) is 21%, which is within the RPD requirement of 50% pursuant to the SSQAPP. The RPD between samples 16A and 16C is 0%.

2.2.2 PCB Recommendations

- Additional PCB sampling should be conducted to determine to what extent, if any, of the PCBs from the flooring paint have leached into the concrete floor substrate. Required removal of PCB materials (such as the flooring paint) must be conducted pursuant to TSCA and may require an EPA approved work plan.

2.3 LEAD BASED PAINT XRF SURVEY

Pursuant to the SSQAPP, the XRF lead based paint (LBP) Survey was conducted pursuant to the Cardno ATC SOP F-SOP-1.19. The LBP XRF survey of the building was conducted on December 10 and 17, 2012. Lead based paint is defined as paint or other surface coatings that contain lead equal to or greater than 1.0 mg/cm^2 (by XRF).

A lead paint analyzer (XRF) was used to sample representative painted components and surfaces for lead content. The following **Table 1** summarizes the various components identified as LBP.

Table 1: Summary of XRF Lead in Paint Results						
Component	***Room No.***	***Condition***	***Substrate***	***Color***	***Location in Room***	***Result (mg/cm^2)***
Windows – All Components	Exterior	Good - Poor	Wood	White	All	>9.9 (maximum reading of instrument)
Side Porch	Exterior	Good	Wood	White	D side	3.0
Window Wells	Throughout Building	Good - Poor	Wood	White	All	>9.9 (maximum reading of instrument)
Wall	Room 21	Good	Brick	Blue	C side	3.0
Door	Room 21	Good	Metal	Green	C side	3.4
Floor	Throughout Basement	Fair - Poor	Concrete	Grey	All	1.5
Walls and Ceiling	Room 23	Good - Fair	Brick	Green	All	1.5
Walls	Room 24	Good - Poor	Brick	Green	All	3.0
Walls	Room 25	Good	Brick	White	All	3.0
Stair Riser	Room 25	Good	Wood	White	A side	1.1

Individual room by room testing results are contained on the field sheets included in **Appendix C** of this report.

2.3.1 Lead in Paint Quality Assurance/Quality Control

Pursuant to QA/QC procedures within the Cardno ATC SOP (F –SOP-1.19), QA/QC repeat testing was conducted on ten (10) surfaces. A procedure for calculating the retest tolerance limit is specified in the XRF instrument Performance Characteristic Sheet (PCS). The retest conducted by Cardno ATC was within the tolerance limit for the instrument.

Appendix C contains the room location diagram, field sheets, XRF instrument protocol, the repeated testing (QA/QC) results, and the PCS.

2.3.2 Lead in Paint Recommendations

- If Demolition/Renovation activities are planned that would disturb finish coatings, then appropriate work practices should be employed to satisfy the Lead in Construction OSHA Standard (1926.62), including but not limited to representative air monitoring to determine actual employee exposures.
- Copies of this report should be provided to the general contractor and demolition contractor to assist with compliance to VOSHA Lead in Construction Standard.
- Any abatement of lead hazards must be completed by a Vermont licensed lead abatement firm, pursuant to the Vermont Regulations for Lead Control.

- Subsequent to renovation/demolition activities a lead-specific final cleaning should be conducted in all areas and lead in dust sampling should be completed prior to building occupancy.

2.4 LEAD IN DUST SAMPLING

As required by the SSQAPP, lead-in-dust sampling was conducted pursuant to the Cardno ATC SOP F-SOP-1.20.

Cardno ATC collected lead in dust samples from representative locations throughout the facility on December 17, 2012. Lead in dust sampling was conducted to determine existing lead-in-dust levels and to determine potential impacts related to the reported use of the basement as an indoor firing range. On December 10, 2012, Cardno ATC interviewed St. Johnsbury Police Chief Clement Houde and Corporal Gil Roberts regarding the possible former use of the armory building and the location of the former firing range. According to Cpl. Roberts, the building has not included an indoor firing range since at the latest 1992. Upon review of the space, it was determined that the range was likely located in the basement in the vicinity of rooms 26, 27, and 28. Based on this finding, lead in dust samples numbers 13-20 were collected within rooms 26 – 28 (as well as other areas of the building).

Although lead in dust samples are not a regulatory requirement prior to renovation activities, the "clearance levels" contained in the Vermont Regulations for Lead Control (V.S.A. Title 18, Chapter 38) were utilized as de facto target levels for this project. The Vermont clearance levels are 40 µg/ft² for floor samples and 250 µg/ft² for interior window sills.

For lead-abatement projects in Vermont, work areas must be cleaned until clearance dust samples indicate levels of lead-in dust are below the clearance levels. The clearance levels are commonly utilized outside of lead-abatement projects as standards to determine if a response action is needed related to lead in dust contamination. All lead in dust samples were analyzed by EMSL Analytical, Inc. of Cinnaminson NJ by Analytical Method SW846-6010B/C ICP-AES. The following **Table 2** summarizes lead in dust sampling results

Table 2 : Pre Renovation Lead in Dust Sample Results

Sample Number	*Room # / Location*	*Floor*	*Lead Concentration (µg/ft²)*	*VT Clearance Level (µg/ft²)*
F-01	03-Floor	2nd	52	40
S-02	03 – Sill	2nd	86,000	250
F-03	08 – Floor	2nd	250	40
S-04	08 - Sill	2nd	20,000	250
F-05	04 - Floor	2nd	230	40
F-06	10 - Floor	2nd	130	40
F-07	12 - Floor	1st	2.7	40
S-08	12 - Sill	1st	1,200	250
F-09	16 - Floor	1st	21	40
S-10	16 - Sill	1st	4,300	250
F-11	17 - North Floor	1st	6	40
F-12	17 - South Floor	1st	7.5	40
F-13	26 - East Floor	Basement	430	40
F-14	26 - Center Floor	Basement	350	40
F-15	26 - West Floor	Basement	340	40
S-16	26 - East Sill	Basement	860	250
S-17	26 - Center Sill	Basement	1,800	250
S-18	26 - West Sill	Basement	390	250
F-19	28 - Floor	Basement	83	40
F-20	27 - Floor	Basement	260	40
F-21	29 - Floor	Basement	670	40
F-22	32 - Floor	Basement	590	40
F-23	21 - Floor	Basement	510	40
F-24	23 - Floor	Basement	2,600	40
F-25	Field Blank	NA	BDL	Not Applicable
F-26	Blind Spike*	NA	180 µg	Not Applicable

** - Spike Known Value of 232.6 µg*

As noted in **Table 2**, lead-in-dust results above target/clearance levels were identified in all levels of the building. Sample results above the target levels are shaded in **Table 2**; rooms where the former firing range was apparently located have also been highlighted (in yellow) in **Table 2.**

2.4.1 Lead in Dust Quality Assurance/Quality Control

Pursuant to QA/QC procedures within the SSQAPP Cardno ATC submitted one "blind" lead-in-dust spike sample (sample # F-26) with a known lead content of 232.6 µg. Pursuant to the SSQAPP the acceptance criteria is within +/- 30% of the known lead content (162.82 – 302.38 µg). The analysis result of the spike sample was 180 µg and therefore falls within the acceptance criteria. In addition, no lead was detected in the field blank (sample # F-25).

Appendix D contains the lead in dust sample location diagram (which includes the approximate location of the former firing range) and the lead in dust laboratory hardcopy results.

2.4.2 Lead in Dust Recommendations

- Copies of this report should be provided to the general contractor and demolition contractor to assist with compliance to VOSHA Lead in Construction Standard.
- Subsequent to renovation/demolition activities a lead-specific final cleaning should be conducted in all areas and lead in dust sampling should be completed prior to building occupancy.

2.5 Indoor Air Quality Investigation

Pursuant to the SSQAPP, Cardno ATC conducted air sampling for culturable fungi and total fungal structures in four (4) indoor locations and one (1) outdoor location for comparison. *The mold assessment was conducted pursuant to the Cardno ATC "Guidelines for Environmental Sampling for Microbial Contamination" (April 2002) hereby incorporated into the Cardno ATC Generic QAPP as Cardno ATC SOP F-SOP-1.21.*

Cardno ATC utilized an Andersen N6 sampler to collect the airborne culturable mold samples on malt extract agar plates for 5 minutes at a flow rate of approximately 27.29 liters per minute. Zefon Air-O-Cell™ microbial spore trap cassettes and a Buck Bio-Aire sampling pump (serial number B150547) were used to collect each sample of total airborne fungal structures for 10 minutes at a flow rate of 15 liters per minute. Both bioaerosol sampling techniques were calibrated prior to sample collection. Bulk (swab) samples were also collected in areas of apparent mold growth.

The air and bulk samples were submitted to EMSL Analytical Inc. of Cinnaminson NJ for analysis of predominant mold species and concentrations.

The American Conference of Governmental Industrial Hygienists (ACGIH) considers comparison of indoor/outdoor bioaerosol data a common method for evaluating indoor fungal reservoirs or concerns. In well maintained indoor environments, the total concentrations of fungi in the indoor air are commonly equal to, or less than, the total concentration outdoors. If indoor fungal bioaerosol concentrations are greater than those outdoors, then indoor fungal reservoirs are likely to be present (however winter conditions will generally result in lower outdoor levels). In addition, the types (i.e., taxa or groups) of fungal bioaerosols found inside a building should be qualitatively similar to the taxa recovered outdoors; presuming outdoor air is the only source of indoor fungal bioaerosols. There are no regulatory standards or other widely accepted numerical guidelines available for interpretation of bioaerosol data. Current ACGIH guidelines refrain from providing numerical thresholds for bioaerosols.

The following **Table 3** presents the total quantitative results for the culturable air samples:

Table 3: Culturable Sample Analysis			
Sample Number	***Location***	***Predominant Species***	***Total CFU/m^3***
IP-01	Exterior – North Door	*Penicillium*	98
IP-02	Room 3 – 2nd Floor	*Aspergillus*	210
IP-03	Room 11 – 1st Floor	*Aspergillus*	511
IP-04	Room 25 - Basement	*Aspergillus*	252
IP-05	Field Blank	*None Detected*	-

Predominant culturable species found indoors (Aspergillus) were different than the predominant species noted outdoors (Penicillium). The outdoor total was lower than indoor concentrations. Based on Cardno ATC's experience the indoor levels are not considered significantly elevated and due to ambient temperatures being at or below freezing (which would serve to reduce the total cultural spore concentrations and types found outside) it is not unusual for indoor levels to exceed outdoor levels under these conditions. The predominant types of fungi identified (inside and outside) are common types of fungi. Based on Cardno ATC's experience the culturable levels identified do not represent a significant concern.

The following **Table 4** presents the quantitative results for the total airborne fungal structure samples:

Table 4: Total Airborne Fungal Structure Sample Analysis

Sample Number	***Location***	***Predominant Species***	***Total Structures/m^3***
Z-01	Exterior – North Door	*Aspergillus/Penicillium*	611
Z-02	Room 3 – 2nd Floor	*Aspergillus/Penicillium*	577
Z-03	Room 11 – 1st Floor	*Aspergillus/Penicillium*	458
Z-04	Room 25 - Basement	*Aspergillus/Penicillium*	3,187
Z-05	Field Blank	*None Detected*	-

The predominant spore types found outdoors were similar to the indoor predominant types (Aspergillus/Penicillium) and except for the basement sample the totals were similar as well. The basement (room 25) level however, did indicate a possible amplification of Aspergillus/Penicillium fungal types.

The following **Table 5** presents the total qualitative results for the swab samples:

Table 5: Fungal Structure Swab Sample Analysis

Sample Number	***Location***	***Substrate***	***Area (ft^2)***	***Predominant Species***	***Category Count***
S-01	Room 16/11 – wall Bottom of Stairs	*Plaster*	*<1*	*Chaetomium*	High
				Penicillum	Medium
				Aspergillus	Rare
S-02	Room 03 – West Wall	*Plaster*	*<1*	*Penicillium/Aspergillus*	Rare
				Cladosporium	Rare
S-03	Room 16 – Ceiling	*Structural Wood*	*25*	*None Detected*	-
S-04	Field Blank	*Not Applicable*	*Not Applicable*	*None Detected*	-

As noted in Table 5 above, only limited areas of apparent visual fungal growth were noted by Cardno ATC Swab samples (samples S-01, S-02 and S-03) were collected from areas of apparent growth. Analysis of swab samples for fungal spores and structures indicated the presence of common fungal structures on only two of the three swab samples. Extensive fungal growth was not observed by Cardno ATC within the building. **Appendix E** includes the fungi sample location diagram and laboratory hardcopy results of the fungi sampling.

2.5.1 IAQ Quality Assurance/Quality Control

Indoor air quality sampling was conducted pursuant to Cardno ATC's "Guidelines for Environmental Sampling for Microbial Contamination". One field blank sample was collected for each type of fungal analysis. No contamination was noted on any of the field blank samples.

2.5.2 IAQ Recommendations

- If significant fungal growth is identified during renovation/demolition activities, removal of the growth should be conducted pursuant to the EPA document Mold Remediation in Schools and Commercial Buildings (EPA 402-K-01-001).
- Subsequent to renovation/demolition activities a final HEPA cleaning should be conducted in the basement area.
- Any sources of water infiltration should be corrected. Continued water infiltration (such as roof leaks) would likely cause additional IAQ related problems. If renovations are not planned for the near-future, additional mold sampling may be warranted.

2.6 SEDIMENT SAMPLING AND DYE TEST

Cardno ATC conducted an investigation related to the presence of the floor drain system in the basement, to help determine potential impacts to the subsurface related to potential vehicle maintenance previously conducted in the basement level. The investigation included a visual inspection of the drain system, interviewing individuals with knowledge of the building's historical use, sampling of sediment in the floor drain itself, as well as performing a dye tracing test to determine the discharge location of the drain system.

The floor drain system in the basement consists of and exterior catch basin adjacent to the southwest entrance, an abandoned trench drain in the southwest corner, a floor drain to the north of the trench drain, a sump pump adjacent to the floor drain and a clean-out pit in the northeast corner of the basement. All the basement catch basins and sump/pump appear to discharge tot the main wastewater line for the building which runs along the north wall and to the cleanout-pit (see dye-test results below). **Appendix F** contains a diagram of the configuration of the floor drain system.

On December 10, 2012, Cardno ATC interviewed St. Johnsbury Police Corporal Gil Roberts regarding the drainage configuration in the vicinity of room 28. Cpl. Roberts described the Police Department's historical use of the room (vehicle maintenance, cleaning, and storage) as well as drainage patterns during use.

The visual examination and Cpl. Roberts' description both indicated that wastewater entering the floor drain in room 28 flows north into the sump at the north end of room 28. A sump pump lifts that water into the building main wastewater line in room 29. From room 29, the main wastewater line runs east along the north wall of the basement, until it reaches a cleanout/trap in a pit in the northeast corner of room 21. From there it continues generally east to the city sewer under Main St.

On December 17, 2012, sediment samples from the floor drain in room 28 were collected to be analyzed for the following analytes: diesel range organics (S-01) via EPA SW-846 Method 8015B – DRO., mercury (S-03) via EPA SW-846 Method 7471B, metals (S-05) via EPA SW-846 Method 6010 C and volatile organic compounds (S-07) via EPA SW-846 Method 8260B. Duplicate samples were collected of each (S-02, S-04, S-06, and S-08, respectively). All sediment samples were collected pursuant to Cardno ATC's standard operating procedure F-SOP-1.7. The results of the sediment sampling were compared to the Soil Screening Values (SSVs) for industrial and commercial properties as listed in the Vermont Department of Environmental Conservation's "Investigation and Remediation of Contaminated Properties

Procedures". **Sediment concentrations of arsenic and bromomethane exceeded the SSVs.** It should be noted that concentrations of four analytes were identified in S-08 (duplicate) that were not identified in S-07. None of these additional detections exceeded the relevant SSV. A summary of sediment sample detections (from the initial sediment samples) are provided in the following **Table 6**:

Table 6: Sediment Sample Detections

Sample Number	*Analyte*	*Result*	*SSV*	*Unit*
S-01	DRO*	120	1,000	mg/kg
S-03	Mercury	0.063	43	mg/kg
S-05	Antimony	0.54	410	mg/kg
S-05	Arsenic	2.5	1.6	mg/kg
S-05	Beryllium	0.38	2,000	mg/kg
S-05	Cadmium	0.45	800	mg/kg
S-05	Chromium	19.3	103	mg/kg
S-05	Copper	56.4	41,000	mg/kg
S-05	Lead	62.1	800	mg/kg
S-05	Nickel**	20.1	20,000	mg/kg
S-05	Zinc	101	310,000	mg/kg
S-07	Bromomethane	37	32	µg/kg
S-07	Acetone	310	630,000	µg/kg
S-07	Methyl acetate	120	1,000,000	µg/kg

* - Diesel Range Organics, compared to the SSV for Total Petroleum Hydrocarbons

On December 18, 2013, a dye test was performed to confirm the discharge point of the building wastewater system. Hugh Wescott of the St. Johnsbury Department of Public Works (DPW) visited the site. Mr. Wescott indicated that he has no knowledge of any wastewater discharge from the armory building other than the main wastewater line to the city sewer. DPW provided access to a sewer junction (manhole) downstream of the armory. Dyed water was released into the cleanout in the northeast corner of room 21. Approximately six minutes later, dye was observed flowing through the downstream manhole, located east of the site in a parking lot off of Route 2 (this downstream manhole location is depicted on the Site Diagram).

The results of this investigation indicate the likelihood that any pollutant captured by the floor drain system in room 28 would have been discharged to the city wastewater system and it would be unlikely that a significant impact to the subsurface has occurred on site.

2.6.1 Sediment Sampling Quality Assurance/Quality Control

The sediment sampling was conducted pursuant to the Cardno ATC "Standard Procedure, Sediment Sampling" hereby incorporated into the Cardno ATC Generic QAPP as Cardno ATC SOP F-SOP-1.7. Of analytes that were detected in the sediment samples, only acetone (a common laboratory contaminant) was found in excess of the relative percent difference requirements established in the QAPP. It should be noted that, due to laboratory equipment malfunctions, analysis of the VOC duplicate samples was completed outside of the holding time. However, due to the relative consistency between the initial and duplicate samples Cardno ATC considers the data to be valid.

2.6.2 Sediment Sampling and Dye Test Recommendations

Results of the investigation indicate elevated levels of some pollutants in the floor drain sediment. Any sediment (likely less than on 55-gallon drum) associated with the floor drain system should be excavated and disposed of according to all applicable state and federal regulations.

Signatures of Environmental Professionals

Cardno ATC has performed above activities in general conformance with the project QAPP (Addenda F-1) for the Former St. Johnsbury Armory located in St. Johnsbury, VT.

List of Suspect Asbestos-Containing Materials

List of Suspect Asbestos Containing Homogeneous Materials
Former St. Johnsbury Armory
1249 Main Street
St. Johnsbury, Vermont
December 10, 2012
ATC Project # 63.35078.0013

Homogeneous Material	Description	% Asbestos	Sample Number	Approx. Quantities
H1	Door Caulking – Exterior Gray	ND*	01A-01C	NA
H2	Window Caulking – Exterior White	ND*	02A-02C	NA
H3	Window Glazing – Exterior White		03A-03C	NA
H4	**Window Caulking – Exterior White**	**Trace***	**04A-04C**	**NQ Exterior window to brick**
H5	**Tar Brick Caulking - Exterior**	**Trace***	**05A-05C**	**NQ Exterior under roof edge**
H6	Flashing- Exterior Silver	ND*	06A-06 C	NA
H7	Roof Field – Built up pebble and Tar	ND*	07A-07C	NA
H8	Roofing Felt	ND*	08A-08C	NA
H9	Caulk at Gambrel Flashing – Exterior Black	ND*	09A-09C	NA
H10	2x4 Ceiling tile – Worms and Pinholes	ND	Previously Sampled	NA
H11	**Plaster Walls and Ceilings**	**2%**	**Previously Sampled**	**NQ Throughout facility**
H12	Carpet Mastic	ND*	12A-12C	NA

ND = Non Detected by Polarized Light Microscopy (PLM)
NA= Not Applicable NQ = Not Quantified

* - PLM is not consistently reliable for detecting asbestos in non-friable organically bound (NOB) materials (e.g. floor tiles, roofing, mastics). Therefore if PLM analysis has concluded that asbestos was not detected in a non-friable organically bound material, Quantitative TEM with NOB prep is the recommended analytical method that should be used to confirm that a material is negative.

Trace: Materials containing "trace" amounts of asbestos (<1%) are not considered Asbestos Containing Materials (ACM) by the US EPA and many state agencies. However, certain sections of OSHA standard 29 CFR 1926.1101 apply when such materials are subject to demolition. Refer to "OSHA Standard Interpretation and Compliance Letter" dated 8/13/1999, subject: "Requirements for demolition operations involving material containing <1% asbestos".

NOTES:

1) The Limit of Detection is the same as the Reporting Limit for these results.

2) The Reporting Limit (RL) is the Limit of Quantitation. For point counts the limit of quantitation of 0.25%; based on one asbestos point counter over 400 non-empty points.

3) Asbestos Containing Material (ACM) Definition: > 1% asbestos by weight is considered an ACM

4) Disclaimer: The laboratory is not responsible for sample collection. Please refer to enclosed letter. This report may not be reproduced, except in full, without written approval by ATC Associates Inc. This report may not be used to claim product endorsement by NVLAP or any other agency of the U.S. Government. This report relates only to the samples reported above as described in the chain of custody. Quality control data is available upon request.

5) Accredited by NVLAP #101187-0 and by NY State ELAP #10679

6) Confidentiality Notice: The document(s) contained herein are confidential and privileged information, intended for the exclusive use of the individual or entity named above.

7) Liability Notice: ATC Associates Inc. and its personnel shall not be liable for any misinformation provided to us by the client regarding these samples. This report relates only to samples submitted and analyzed.

8) When the results display more than three digits, only the first three are significant. The data within this report is reliable to 3 significant figures.

9) The condition of all samples was acceptable upon receipt.

10) The laboratory certifies that the test results meet all requirements of NELAC.

11) Supplement to test report batch # _____. Amendments: ____. Amendment Dates: _____. Amended by: _____

12) PLM Letter is attached on this report.

13) TRACE: The result is reported as Trace when No points are counted and asbestos is identified. For ELAP Trace is < 1%.

14) ATC certifies that this report is an accurate and authentic report of the results obtained from the laboratory analysis

15) The uncertainty for these test results is available upon request.

16) Assume ACM if Vermiculite is ≥ 10%. Not Reported Vermiculite means Not Detected

Amr Fata

BULK ASBESTOS ANALYSIS RESULTS

PLM Analysis Methodology

The samples were analyzed by industry accepted methods in accordance with EPA and ELAP methods using Polarized Light Microscopy (PLM) with dispersion staining in conjunction with stereoscopical analysis. Point counts are performed on samples regulated by these agencies. The Environmental Laboratory Approval Program (ELAP) has determined that analysis of non-friable organically bound materials (i.e. floor tile, roofing, etc.) and ceiling tiles with cellulose is not reliable when performed by Polarized Light Microscopy (PLM) method. Therefore, if this analysis included that of non-friable materials or ceiling tiles with cellulose under PLM and the results were negative, ATC must add this disclaimer to maintain our ELAP accreditation:

" Polarized light microscopy is not consistently reliable in detecting asbestos in floor coverings and similar non-friable organically bound materials. Quantitative Transmission Electron Microscopy is currently the only method that can be used to determine if this material can be considered or treated as non-asbestos containing" .

Non-friable samples that contained *Trace* or *No* PLM detectable asbestos are classified as Inconclusive. Samples that are layered and analyzed by the gravimetric method as composites (NESHAP, AHERA) should be considered positive if results are between trace and 1%, unless every layer is analyzed separately.

ELAP requires that materials containing vermiculite at 10% or more must be reported as ACM.

EPA does not regulate mixed mineral assemblage like the anthophyllite-talc intergrowth that is found in paint and caulking unless these materials contain asbestos in an amount greater than 1%. Anthophyllite detected in paint and caulking samples might be a talc intergrowth.

ATC has the capability of performing TEM confirmation if so desired.

All bulk sample reports are checked and reviewed two times. Unused portions of samples are archived for three months unless client requests special handling. This report must not be used by the client to claim product endorsement by NIST or any agency of the U.S. government.

ATC Associates Inc. is not responsible for sample collection and analytical procedures not performed by our laboratory. This report may not be reproduced in part without the laboratory permission.

ATC Associates will not be liable for analytical results from samples that are not prepared according to the standard methods (EPA, ELAP, etc.) used by the laboratory (e.g. composite samples from different locations, samples with insufficient volumes, straight TEM samples without gravimetric procedures, dust samples, non-friable samples by PLM only).

Laboratory Equipment

Laboratory analysis was accomplished utilizing Olympus BH-2 Microscopes.

Quality Control

ATC Associates Inc. is accredited by NVLAP (Lab Code 101187-0) and NY State DOH ELAP (Lab ID 10879) for bulk and air fiber analyses. ATC participates in the Bulk Asbestos Sample Quality Assurance Programs for NVLAP and ELAP and maintains an in-house QC/QA program for bulk samples whereby 10% of all submitted samples are reanalyzed and documented in a Quality Control Manual. ATC also participates in a quarterly round robin QC/QA program for bulk samples with several accredited laboratories throughout the United States. Current and past QC/QA program results are available in the laboratory for inspection.

Accuracy and Precision

The phase abundances provided by point count may be considered within the limits of variability inherent in the method employed. For point counts the detection limit of 0.25% is based on one asbestos point counted over 400 non-empty points. If no points are counted and asbestos is identified, the result will be reported as trace. For ELAP trace is < 1%.

The analyses were supervised by Milena Bonezzi, Director of Laboratory Services, who has extensive experience in asbestos analysis by PLM and other methods. Please contact me regarding any questions relating to these materials at 212-353-8280 Ext. 247.

1. EPA Methods: 600/M4-82-020 and 600/R-93/116
2. ELAP Method: 4088 Items 198.1 and 198.4 and 198.6

Sincerely,

Milena Bonezzi

12/31/2012

The following analytical report covers the analysis performed on samples submitted to EMSL Analytical, Inc. on 12/27/2012. The results are tabulated on the attached data pages for the following client designated project:

63.35078.0013

The reference number for these samples is EMSL Order #011205781. Please use this reference when calling about these samples. If you have any questions, please do not hesitate to contact me at (856) 303-2500.

Reviewed and Approved By:

Julie Smith - Laboratory Director

The test results contained within this report meet the requirements of NELAC and/or the specific certification program that is applicable, unless otherwise noted.
NELAP Certifications: NJ 03036, NY 10896, PA 68-00367

The samples associated with this report were received in good condition unless otherwise noted. This report relates only to those items tested as received by the laboratory. The QC data associated with the sample results meet the recovery and precision requirements established by the NELAP, unless specifically indicated. All results for soil samples are reported on a dry weight basis, unless otherwise noted. This report may not be reproduced except in full and without written approval by EMSL Analytical, Inc.

XRF Protocol

XRF Protocol

LBP testing was performed at the above referenced site. The testing was performed in general conformance to the United States Department of Housing and Urban Development's (HUD) 1997 Revised Chapter 7 of the Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing (HUD guidelines), dated June, 1995. HUD guidelines define the term lead based paint as paint or other surface coatings that contain lead equal to or greater than 1.0 mg/cm^2 (by XRF) or 0.5 % by weight (laboratory paint chip analysis).

ATC conducted a LBP survey of accessible interior and exterior surfaces of the main residence. Please refer to to the attached Sample Location Diagrams for a diagram of the building complete with room numbers. For a description of the XRF instrument and procedure, see **Appendix B**: "XRF Protocol". **Appendix C** contains appropriate Lead Certifications.

Areas selected for testing were designated as "room equivalents." Pursuant to the HUD Guidelines, a room equivalent is an identifiable part of a residence, such as a room, a house exterior side or an exterior area. Within each room equivalent, "testing combinations" were identified and tested. A testing combination is characterized by a unique combination of room equivalent, building component types, and substrate (for example: all like painted doors with wood substrate within the same room). Pursuant to the 1997 Revision of Chapter 7 HUD Guidelines, one reading was completed for each testing combination except for walls, where one reading was taken for each wall in the room. Testing combinations were tested by using a LPA-1, serial # 1355, X-Ray Fluorescence Analyzer (XRF).

XRF field screening results are noted on the field sheets included within this report under **Appendix A.** Column one of the field sheets contains the type of component tested, the second column contains the condition of the painted surface, either "G" (good), "F" (fair) or "P" (poor). The third column contains the type of substrate of the component (such as wood, sheet rock, etc.). The fourth column contains the color of the painted surface at the time of the testing. Column five contains the side of the room for which the component was tested, indicated as side A, B, C, or D. As depicted on the Diagram(s) included with this report, side A is the side of the room facing the street, and moving in a clockwise direction each additional side perpendicular to the previous side (i.e. angled walls are not assigned a letter) is given the next consecutive letter. Column six contains the XRF result for that reading, column seven contains the XRF result for that reading if the testing was repeated. Column eight includes other *like components* within the room. *Like components* are similar components in the same room equivalent that should be considered to have identical paint content. If a paint chip sample is collected (due to an inconclusive XRF result or odd shaped component) then column nine contains the paint chip sample number and column ten indicates the corresponding laboratory result.

The abbreviation "LBP" will be entered in column eleven for any component and like components that are identified as lead-based paint.

The bottom of each field sheet also contains an area for remarks provided by the inspector which detail specific conditions noted for that particular area tested.

The LPA-1 Lead Paint Analyzer is a complete lead paint analysis system which quickly, accurately, and non-destructively measures the concentration of LBP on surfaces. The LPA-1 relies on the measurement of the K-shell X-rays to determine the amount of lead present in the painted surface. K-shell X-rays can penetrate many layers of paint and allow a good measurement of the lead content of paint to be made without being significantly affected by the thickness or number of layers of paint on the surface of the sample.

The LPA-1 has the ability to analyze and compute corrections for the differences in the energy spectrums relating to different substrates. This analysis of the energy spectrum means that the lead paint reading

displayed on the instrument already accounts for any substrate effects and no correction is required by the operator. The LPA-1's field of view is limited to a depth of 3/8", deep enough to handle virtually all painted surfaces, but not prone to detect lead objects located behind the surface.

There are two measurement modes of operation in the LPA-1 analyzer namely the "Standard Mode" and the "Quick Mode". In the "Standard" mode, the operator selects a fixed measurement time which remains constant irrespective of the lead signal. In the "Quick" mode, the analyzer automatically adjusts the measurement time to be the least time that is needed to make a definitive measurement with a 95% confidence level (2 sigma). The LPA-1 analyzer will finish a measurement once the 2 sigma confidence level is achieved and the data is statistically meaningful. This time period for conclusive measurements is typically between 1 to 5 seconds, but can extend to a measurement of 60 seconds depending on the action level for abatement. ATC utilized the LPA-1 in the "Quick" mode for the testing performed at this unit. The highest level of LBP reported by the LPA-1 using the "Quick" mode is a result of > 9.9 mg/cm2 (greater than 9.9 mg/cm2). This result indicates LBP significantly over the HUD definition of 1.0 mg/cm2.

A "validation test" was performed to ensure that the instrument was operating properly. The validation test was performed on a calibration test block supplied by the manufacturer, as well as the National Institute for Standards and Testing (NIST) 1.02 mg/cm2 test film to determine if the instrument measured the lead content consistently on a day to day basis. A series of three standard measurements consisting of 60 seconds per measurement were taken on the test blocks. The individual readings were recorded and compared to the factory test data provided with the instrument. Please find validation test results on the enclosed field sheets.

Performance Characteristic Sheet

Performance Characteristic Sheet

EFFECTIVE DATE: **October 25, 2006** **EDITION NO.: 5**

MANUFACTURER AND MODEL:

Make: ***Radiation Monitoring Devices***
Model: ***LPA-1***
Source: ^{57}Co
Note: This sheet supersedes all previous sheets for the XRF instrument of the make, model, and source shown above ***for instruments sold or serviced after June 26, 1995. For other instruments, see prior editions.***

FIELD OPERATION GUIDANCE

OPERATING PARAMETERS:

Quick mode or 30-second equivalent standard (Time Corrected) mode readings.

XRF CALIBRATION CHECK LIMITS:

0.7 to 1.3 mg/cm^2 (inclusive)

SUBSTRATE CORRECTION:

For XRF results below 4.0 mg/cm^2, substrate correction is recommended for:

Metal using 30-second equivalent standard (Time Corrected) mode readings.
None using quick mode readings.

Substrate correction is not needed for:

Brick, Concrete, Drywall, Plaster, and Wood using 30-second equivalent standard (Time Corrected) mode readings
Brick, Concrete, Drywall, Metal, Plaster, and Wood using quick mode readings

THRESHOLDS:

30-SECOND EQUIVALENT STANDARD MODE READING DESCRIPTION	SUBSTRATE	THRESHOLD (mg/cm^2)
Results corrected for substrate bias on metal substrate only	Brick	1.0
	Concrete	1.0
	Drywall	1.0
	Metal	0.9
	Plaster	1.0
	Wood	1.0

QUICK MODE READING DESCRIPTION	SUBSTRATE	THRESHOLD (mg/cm^2)
Readings not corrected for substrate bias on any substrate	Brick	1.0
	Concrete	1.0
	Drywall	1.0
	Metal	1.0
	Plaster	1.0
	Wood	1.0

BACKGROUND INFORMATION

EVALUATION DATA SOURCE AND DATE:

This sheet is supplemental information to be used in conjunction with Chapter 7 of the HUD *Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing* ("HUD Guidelines"). Performance parameters shown on this sheet are calculated from the EPA/HUD evaluation using archived building components. Testing was conducted on approximately 150 test locations in July 1995. The instrument that performed testing in September had a new source installed in June 1995 with 12 mCi initial strength.

OPERATING PARAMETERS:

Performance parameters shown in this sheet are applicable only when properly operating the instrument using the manufacturer's instructions and procedures described in Chapter 7 of the HUD Guidelines.

XRF CALIBRATION CHECK:

The calibration of the XRF instrument should be checked using the paint film nearest 1.0 mg/cm^2 in the NIST Standard Reference Material (SRM) used (e.g., for NIST SRM 2579, use the 1.02 mg/cm^2 film).

If readings are outside the acceptable calibration check range, follow the manufacturer's instructions to bring the instruments into control before XRF testing proceeds.

SUBSTRATE CORRECTION VALUE COMPUTATION:

Chapter 7 of the HUD Guidelines provides guidance on correcting XRF results for substrate bias. Supplemental guidance for using the paint film nearest 1.0 mg/cm^2 for substrate correction is provided:

XRF results are corrected for substrate bias by subtracting from each XRF result a correction value determined separately in each house for single-family housing or in each development for multifamily housing, for each substrate. The correction value is an average of XRF readings taken over the NIST SRM paint film nearest to 1.02 mg/cm^2 at test locations that have been scraped bare of their paint covering. Compute the correction values as follows:

> Using the same XRF instrument, take three readings on a bare substrate area covered with the NIST SRM paint film nearest 1 mg/cm^2. Repeat this procedure by taking three more readings on a second bare substrate area of the same substrate covered with the NIST SRM.
>
> Compute the correction value for each substrate type where XRF readings indicate substrate correction is needed by computing the average of all six readings as shown below.
>
> For each substrate type (the 1.02 mg/cm^2 NIST SRM is shown in this example; use the actual lead loading of the NIST SRM used for substrate correction):
>
> $$\text{Correction value} = (1^{st} + 2^{nd} + 3^{rd} + 4^{th} + 5^{th} + 6^{th}\ \textit{Reading}) / 6 - 1.02\ \text{mg/cm}^2$$
>
> Repeat this procedure for each substrate requiring substrate correction in the house or housing development.

EVALUATING THE QUALITY OF XRF TESTING:

Randomly select ten testing combinations for retesting from each house or from two randomly selected units in multifamily housing. Use either the Quick Mode or 30-second equivalent standard (Time Corrected) Mode readings.

Conduct XRF re-testing at the ten testing combinations selected for retesting.

Determine if the XRF testing in the units or house passed or failed the test by applying the steps below.

Compute the Retest Tolerance Limit by the following steps:

Determine XRF results for the original and retest XRF readings. Do not correct the original or retest results for substrate bias. In single-family and multi-family housing, a result is defined as a single reading. Therefore, there will be ten original and ten retest XRF results for each house or for the two selected units.

Calculate the average of the original XRF result and retest XRF result for each testing combination.

Square the average for each testing combination.

Add the ten squared averages together. Call this quantity C.

Multiply the number C by 0.0072. Call this quantity D.

Add the number 0.032 to D. Call this quantity E.

Take the square root of E. Call this quantity F.

Multiply F by 1.645. The result is the Retest Tolerance Limit.

Compute the average of all ten original XRF results.

Compute the average of all ten re-test XRF results.

Find the absolute difference of the two averages.

If the difference is less than the Retest Tolerance Limit, the inspection has passed the retest. If the difference of the overall averages equals or exceeds the Retest Tolerance Limit, this procedure should be repeated with ten new testing combinations. If the difference of the overall averages is equal to or greater than the Retest Tolerance Limit a second time, then the inspection should be considered deficient.

Use of this procedure is estimated to produce a spurious result approximately 1% of the time. That is, results of this procedure will call for further examination when no examination is warranted in approximately 1 out of 100 dwelling units tested.

BIAS AND PRECISION:

Do not use these bias and precision data to correct for substrate bias. These bias and precision data were computed without substrate correction from samples with reported laboratory results less than 4.0 mg/cm^2 lead. The data which were used to determine the bias and precision estimates given in the table below have the following properties. During the July 1995 testing, there were 15 test locations with a laboratory-reported result equal to or greater than 4.0 mg/cm^2 lead. Of these, one 30-second standard mode reading was less than 1.0 mg/cm^2 and none of the quick mode readings were less than 1.0 mg/cm^2. The instrument that tested in July is representative of instruments sold or serviced after June 26, 1995. These data are for illustrative purposes only. Actual bias must be determined on the site. Results provided above already account for bias and precision. Bias and precision ranges are provided to show the variability found between machines of the same model.

30-SECOND STANDARD MODE READING MEASURED AT	SUBSTRATE	BIAS (mg/cm^2)	PRECISION* (mg/cm^2)
0.0 mg/cm^2	Brick	0.0	0.1
	Concrete	0.0	0.1
	Drywall	0.1	0.1
	Metal	0.3	0.1
	Plaster	0.1	0.1
	Wood	0.0	0.1
0.5 mg/cm^2	Brick	0.0	0.2
	Concrete	0.0	0.2
	Drywall	0.0	0.2

	Plaster	0.0	0.2
	Wood	0.0	0.2
1.0 mg/cm^2	Brick	0.0	0.3
	Concrete	0.0	0.3
	Drywall	0.0	0.3
	Metal	0.2	0.3
	Plaster	0.0	0.3
	Wood	0.0	0.3
2.0 mg/cm^2	Brick	-0.1	0.4
	Concrete	-0.1	0.4
	Drywall	-0.1	0.4
	Metal	0.1	0.4
	Plaster	-0.1	0.4
	Wood	-0.1	0.4

*Precision at 1 standard deviation.

CLASSIFICATION RESULTS:

XRF results are classified as positive if they are greater than the upper boundary of the inconclusive range, and negative if they are less than the lower boundary of the inconclusive range, or inconclusive if in between. The inconclusive range includes both its upper and lower bounds. Earlier editions of this *XRF Performance Characteristics Sheet* did not include both bounds of the inconclusive range as "inconclusive." While this edition of the Performance Characteristics Sheet uses a different system, the specific XRF readings that are considered positive, negative, or inconclusive for a given XRF model and substrate remain unchanged, so previous inspection results are not affected.

DOCUMENTATION:

An EPA document titled *Methodology for XRF Performance Characteristic Sheets* provides an explanation of the statistical methodology used to construct the data in the sheets, and provides empirical results from using the recommended inconclusive ranges or thresholds for specific XRF instruments. For a copy of this document call the National Lead Information Center Clearinghouse at 1-800-424-LEAD. A HUD document titled *A Nonparametric Method for Estimating the 5th and 95th Percentile Curves of Variable-Time XRF Readings Based on Monotone Regression* provides supplemental information on the methodology for variable-time XRF instruments. A copy of this document can be obtained from the HUD lead web site, www.hud.gov/offices/lead.

This XRF Performance Characteristic Sheet was developed by QuanTech, Inc., under a contract from the U.S. Department of Housing and Urban Development (HUD). HUD has determined that the information provided here is acceptable when used as guidance in conjunction with Chapter 7, Lead-Based Paint Inspection, of HUD's *Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing.*

12/31/2012

The following analytical report covers the analysis performed on samples submitted to EMSL Analytical, Inc. on 12/21/2012. The results are tabulated on the attached data pages for the following client designated project:

63.35078.0013

The reference number for these samples is EMSL Order #011205745. Please use this reference when calling about these samples. If you have any questions, please do not hesitate to contact me at (856) 303-2500.

Reviewed and Approved By:

Julie Smith - Laboratory Director

The test results contained within this report meet the requirements of NELAC and/or the specific certification program that is applicable, unless otherwise noted.
NELAP Certifications: NJ 03036, NY 10896, PA 68-00367

The samples associated with this report were received in good condition unless otherwise noted. This report relates only to those items tested as received by the laboratory. The QC data associated with the sample results meet the recovery and precision requirements established by the NELAP, unless specifically indicated. All results for soil samples are reported on a dry weight basis, unless otherwise noted. This report may not be reproduced except in full and without written approval by EMSL Analytical, Inc.

Comments:

- must called due to method being used (EMSL SOP 001 Revision 7 or Pb-FLAA?)
- Called. Eric picked up. gave me Harland Miller's number 1:54pm 12/21/12
- Called Harland Miller's number. He answered but said he will call back to give type of method. He was not sure of method. 1:57pm 12/21/12
- Harland Miller called back. He decided to get ICP-AES method, not Pb-FLAA (lead contact+dust) 2:03pm 12/21/12

Myxomycetes++ = Myxomycetes/Periconia/Smut

No discernable field blank was submitted with this group of samples.

Farbod Nekouei, M.S., Laboratory Manager
or Other Approved Signatory

High levels of background particulate can obscure spores and other particulates leading to underestimation. Background levels of 5 indicate an overloading of background particulates, prohibiting accurate detection and quantification. Present = Spores detected on overloaded samples. Results are not blank corrected unless otherwise noted. The detection limit is equal to one fungal spore, structure, pollen, fiber particle or insect fragment. "*" Denotes particles found at 300X. "-" Denotes not detected. Due to method stopping rules, raw counts in excess of 100 are extrapolated based on the percentage analyzed. EMSL maintains liability limited to cost of analysis. This report relates only to the samples reported above and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. Interpretation and use of test results are the responsibility of the client. Samples received in good condition unless otherwise noted.

Sediment Sample Laboratory Report

TestAmerica
THE LEADER IN ENVIRONMENTAL TESTING

ANALYTICAL REPORT

Job Number: 200-14287-1

Job Description: St. J Armory

For:
Cardno ATC
171 Commerce Street
PO BOX 1486
Williston, VT 05495

Attention: Mr. Stephen Znamierowski

Approved for release.
Sara S Goff
Project Manager I
2/5/2013 8:42 AM

Sara S Goff
Project Manager I
sara.goff@testamericainc.com
02/05/2013
Revision: 1

The test results in this report relate only to sample(s) as received by the laboratory. These test results were derived under a quality system that adheres to the requirements of NELAC. Pursuant to NELAC, this report may not be produced in full without written approval from the laboratory

CASE NARRATIVE

Client: Cardno ATC

Project: St. J Armory

Report Number: 200-14287-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT
The samples were received on 12/19/2012; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 5.0 C.

Client has revised Chain-of-Custody with sample identifiers that match what is recorded on the container labels.

VOLATILE ORGANIC COMPOUNDS (GC-MS)
Samples S-07 and S-08 were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were prepared on 12/20/2012 and analyzed on 01/03/2013, 12/28/2012 and 12/31/2012.

Sample S-08 required a dilution which was performed outside of the analytical holding time. The original undiluted analysis which was performd within analytical hodling time has also been provided.

Due to poor aquisition of both low level sample aliquots the medium level aliquot was analyzed and reported.

Several analytes were detected in method blank MB 200-50187/5 at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

No other difficulties were encountered during the volatiles analyses. All other quality control parameters were within the acceptance limits.

DIESEL RANGE ORGANICS
Samples S-01 and S-02 were analyzed for diesel range organics in accordance with EPA SW-846 Method 8015B - DRO. The samples were prepared on 12/31/2012 and analyzed on 01/04/2013.

Samples S-01[3X] and S-02[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No difficulties were encountered during the DRO analyses. All quality control parameters were within the acceptance limits.

METALS (ICP)
Samples S-05 and S-06 were analyzed for Metals (ICP) in accordance with EPA SW-846 Method 6010C. The samples were prepared on 12/28/2012 and analyzed on 12/29/2012.

The serial dilution performed for sample S-05 was outside control limits for Chromium, Copper, Nickle, and Zinc. The post digestion spike percent recovery for sample S-05 was outside of control limits for Beryllium, Cadmium, Chromium, Copper, Nickle, Selenium, and Zinc.

No difficulties were encountered during the metals analyses. All quality control parameters were within the acceptance limits.

MERCURY
Samples S-03 and S-04 were analyzed for mercury in accordance with EPA SW-846 Method 7471B. The samples were prepared on 12/26/2012 and analyzed on 12/28/2012.

Hg was detected in method blank MB 200-50058/11-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

No other difficulties were encountered during the mercury analyses. All other quality control parameters were within the acceptance limits.

DATA REPORTING QUALIFIERS

Client: Cardno ATC

Job Number: 200-14287-1

Lab Section	Qualifier	Description
GC/MS VOA		
	B	Compound was found in the blank and sample.
	U	Indicates the analyte was analyzed for but not detected.
	E	Result exceeded calibration range.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	H	Sample was prepped or analyzed beyond the specified holding time
GC Semi VOA		
	U	Indicates the analyte was analyzed for but not detected.
Metals		
	B	Compound was found in the blank and sample.
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

RE: PCB Building Material Survey
St. Johnsbury Armory Building
St. Johnsbury, Vermont
ATC Project # 280BS00783

Dear Joe,

The following report details the PCB in building material sampling, PCB wipe sampling, and airborne PCB concentration sampling conducted by ATC Group Services LLC (ATC) at the St. Johnsbury Armory located in St. Johnsbury, Vermont.

ATC was retained by the City of St. Johnsbury (ST. J) to perform a survey for the presence of polychlorinated biphenyls (PCBs) in suspect building materials associated with the building. The survey was conducted as a supplement to a previous PCB screening survey conducted by ATC for the Northeastern Vermont Development Association (NVDA) dated November 28, 2012. The objective of that and this current survey is evaluate for the presence of PCB-containing materials (i.e. various caulking, paint and glazing compound materials) that would require special management as part of the building renovation project.

The facility is constructed primarily of brick, with a concrete foundation. The windows are constructed of wood panel frames. The previous NVDA report indicated the presence of PCB's in various paint and caulking materials, some of which exceeding the EPA action level of 50 ppm.

Sampling was performed in a phased manner during between November 21, 2016 and December 21, 2016, as summarized below:

Airborne PCB Concentration Sampling – November 21, 2016

Airborne PCB Concentration samples were collected from two (2) indoor areas and one (1) exterior area of the facility prior to the disturbance of building materials. Additionally one (1) field blank sample was collected for quality control purposes. Indoor samples were collected from the basement (area of highest previously identified PCB containing material) and the first floor (area identified as next most likely to be impacted by PCB containing materials). Samples were submitted to Con-test Analytical Laboratory in East Longmeadow, MA for laboratory analysis via EPA To-10A/EPA 680 (Homolog) analysis.

The following Table 1 details the laboratory results of Airborne PCB Concentration samples:

Table 1: Airborne PCB Concentration Results- November 21, 2016:

Sample Number	Location Description	Total PCB Results* ug/m^3
PCBV-1	Exterior	0.0068
PCBV-2	First Floor- Main Drill Hall	0.12
PCBV-3	Basement- Center large open area	0.033
PCBV-4	Field Blank	0.0086 ug

*Total= Total of all Homologs detected

Total Airborne PCB concentrations can be compared to the US EPA's Regional Screen Level (RSL) for Composite Worker Ambient Air Table (May 2016 version). The 2016 RSL provides Carcinogenic Target Risk Values for High Risk, Low Risk and Lowest Risk comparisons. These values would be selected based on the population utilizing the building, how long that population was potentially in the building and various other risk factors for exposure. Since this building is currently unoccupied the lowest risk value was used for comparison purposes.

The 2016 EPA RSL for Lowest Risk Value is 0.61 ug/m^3. Sample results for the armory building show that the indoor airborne concentrations for all samples were below the 2016 RSL lowest risk value.

PCB Bulk Sampling – November 22, 2016

Additional PCB bulk samples of suspect materials were collected of previously sampled suspect PCB containing materials. The initial NVDA survey consisted of two (2) samples of each homogeneous area. Recent EPA guidance has illustrated the need for a minimum of three (3) sample to be collected for each material. ATC collected a total of nine (9) bulk samples of suspect materials for laboratory analysis to meet the EPA guidelines. Samples were submitted to Con-test Analytical Laboratory in East Longmeadow, MA for laboratory analysis via EPA 3540C/8082 (full soxhlet extraction) analysis.

The EPA regulatory limit ("not authorized for use" under the Toxic Substances Control Act of 1976 [TSCA]) for PCBs in building materials is 50 parts per million (ppm). The following Table 2 summarizes the PCB Bulk sampling results for the NVDA report and the subsequent ATC sampling event on November 21, 2017:

Table 2: PCB Bulk Sample Results:

Sample Number	Description	Highest 2012 concentration mg/kg (ppm)	2017 Sample Result mg/kg (ppm)
PCB-2C	Exterior Window Caulk- newer	1.5	ND
PCB-3C	Exterior Window Glaze	ND	0.87
PCB-4C	Exterior- Window Caulk- old	26	0.81
PCB-5C	Exterior Tar Caulking	ND	ND
PCB-6C	Silver Flashing	ND	ND
PCB-9C	Black Rood Caulking	ND	ND
PCB-16D	**Grey Floor Paint – Basement**	**5,700**	**20,000**
PCB-19C	White Wall Paint	7.4	9.0
PCB-20C	**Blue Floor Paint- Basement**	**44**	**67.0**

ND= None Detect **Bold=** Materials in excess of 50 mg/Kg

The combined sample results mostly confirm previous sampling results with the exceptions of the blue basement floor paint which is now identified as exceeding the EPA regulatory threshold along with the Grey basement floor paint. The Grey and Blue basement color paint are considered to be prohibited use products and as such classified as Bulk Product Waste under TSCA and its implementing regulation at 40 CFR Part 761.

Several of the materials were found to contain levels of PCB's in detectable levels but below the EPA regulatory threshold. These materials will either be classified as PCB remediation waste or PCB Exempt material. These materials include the Exterior window caulking (two types) and the white interior wall paint.

PCB excluded waste is any material installed prior to 1984 that has been showed to have PCB concentrations below 50 ppm and not impacted by other PCB containing materials. It is likely that the exterior window caulking would meet this definition as no other PCB containing materials are located in proximity to the material and the windows appear to have been installed prior to 1984. Excluded Wastes are not required to be removed by TSCA regulations, however, can still present a potential exposure risk.

PCB remediation waste is any material with a PCB concentration great than 1 ppm and less than 50 ppm that has been directly impacted by another material with a concentration great than 50. These materials must be managed according to EPA directive or removed according to applicable regulations.

PCB Surface Wipe Sampling – November 22, 2016

ATC conducted PCB wipe sampling of the interior floor surfaces throughout the facility to determine if PCBs have impacted or settled on the interior surfaces within the facility.

ATC collected 11 wipe samples and 1 Blank from various floor surfaces throughout the facility. Wipe samples were submitted to Con-test Analytical Laboratory in East Longmeadow, MA for laboratory analysis via EPA 3540C/8082 (full soxhlet extraction) analysis.

The following table 3 summarizes the PCB Interior PCB Wipe sampling results:

Table 3: PCB Wipe Sample Results- November 22, 2017:

Sample Number	Sample Location	Results ug/100 cm^2
W-01	Field Blank	ND
****W-02**	**Room 25- at room 37**	**4,500**
****W-03**	**Room 26- East Center**	**23**
W-04	**Room 11- Top of Stairs**	**110**
W-05	**Room 16- Center**	**3.7**
W-06	**Room 11 – at door to room 17**	**5.2**
W-07	**Room 17- 10' from door to room 11**	**2.0**
W-08	Room 14- North on path to room 13	0.89
W-09	Room 17- Southwest	0.22
W-10	**Room 3- Top step of stairs**	**9.4**
W-11	Room 3- at door to room 9	0.81
W-12	Room 5- at door to room 3	0.34

ND – Below noted laboratory reporting limits (RL) **-PCB Painted surface **Bold**= materials in excess of 1 ug/cm^2

Results of the above wipe samples indicate that all 11 wipe samples collected were found to contain detectable levels of PCBs. These levels are generally highest at in the area of PCB containing paint and generally reduce as foot traffic would move from this area to other parts of the facility. This pattern is typical of contaminants being moved via foot traffic carrying the material throughout the building.

Please note that the wipe testing is designed for non-porous surfaces such as metal and ceramic tile but it is a useful tool for preliminary evaluations. The interior wipe sample results (levels above the common post abatement standard of 1.0 ug/100 cm^2) indicate that PCBs are present in significant quantities in these areas.

PCB Basement Concrete Coring Sampling – November 27, 2016

ATC conducted concrete coring sampling of the interior floor surfaces throughout the basement slab of the facility to determine if PCBs in the painted material have impacted the underlying substrate.

ATC collected a total of 36 concrete core samples from various areas of the basement areas identified as having PCB containing paint above the EPA regulatory threshold of 50 ppm. 28 core samples, including one (1) duplicate sample collected for quality control purposes, were collected from seven (7) locations with in the basement area at a variety of depths to identify how deep, if any, PCB's have impacted the substrate. Samples were collected from 0.0 to 0.25", 0.25 to 0.5", 0.5 to 1.0" and 1.0 to 1.5" depths. In seven (7) additional locations samples were collected from the 0.0 to 0.5" depth interval only. This was done to determine if patterns were present across the painted portion of the slab while limiting sampling analysis costs.

Samples were collected in general conformance with EPA Region 1 *Standard Operating Procedure for Sampling Porous Surfaces for Polychlorinated Biphenyls (PCBs) Revision 4,* dated May 5, 2011. Core samples were submitted to Con-test Analytical Laboratory in East Longmeadow, MA for laboratory analysis via EPA 3540C/8082 (full soxhlet extraction) analysis.

The following table 4 summarizes the concrete core sample results:

Table 4: PCB Concrete Core Sample Results- November 27, 2017:

Sample Location	Results mg/kg (ppm) 0.0 to 0.25" depth	Results mg/kg (ppm) 0.25 to 0.50" depth	Results mg/kg (ppm) 0.50 to 1.0" depth	Results mg/kg (ppm) 1.0 to 1.5" depth	Results mg/kg (ppm) 0.0 to 0.50" depth

NS- No Sample collected for interval depth (#) - Duplicate sample for QA/QC purposes

All but 4 of the sample results of the above concrete cores samples indicate that the concrete slab of the painted portion of the basement has been impacted to a depth of at least 1.5" by PCB contamination at levels above the 1 mg/Kg Remediation Waste standard.

These results indicated that the painted portion of the concrete slab of the basement area would be considered a PCB remediation waste material and subject to EPA regulatory authority to a depth of at least 1.5".

Additionally, ATC advanced four (4) cores from the slab surface to the subsurface of the slab to determine approximate slab thicknesses. The concrete slab was observed to range between 2.5" to 5" in thickness.

Data Usability

The laboratories utilized did not report any quality control/quality assurance issues with their analyses which would affect the usability of the data for this project.

Recommendations:

Identified PCB Bulk Product Waste (basement grey and blue floor paint) must be removed in accordance with TSCA and disposed off-Site at a landfill that can accept PCB Bulk Product Waste. TSCA requires that all PCB Bulk Product Waste be removed. TSCA does not prescribe a schedule for this removal. This can be accomplished in one of the two following manners:

1) ATC recommended approach - Develop a Performance Based abatement plan to remove identified PCB Bulk Product Waste and PCB Remediation Waste that might be present; incorporate PCB abatement requirements into project Technical Specifications; and implement abatement plan, with oversight by a qualified environmental professional.
    a. Based upon current data, ATC envisions that a Performance-Based approach would include the removal of the entirety of the painted basement slab as PCB Bulk Product. Cleaning or removal of impacted flooring materials from the remainder of the facility as PCB remediation waste. Dispose of all materials at a landfill that is permitted to accept PCB Bulk and Remediation Product wastes. Dispose of all containment, PPE, filters and tools that cannot be decontaminated as PCB waste with PCB concentrations > 50 ppm.

2) Develop a Risk Based Remediation plan which would remove all PCB Bulk Product Waste and manage all PCB Remediation Waste (identified as materials impacted by Bulk Product waste in concentrations greater than 1 ppm) in place. This would require management and removal be conducted in accordance with 40 CFR 761.61(b) following approval from the EPA.

As part of the PCB remediation design and implementation procedure for either option additional sampling will be required. These items could be include but are not limited to painted surfaces and sub slab soil sampling.

Limitations

Our professional services have been performed and our findings obtained and prepared in accordance with customary principles and practices in the field of environmental science and engineering. This statement is in lieu of other statements either expressed or implied. This report does not warrant against future operations or conditions, nor does it warrant against operations or conditions present of a type or at a location not investigated. Environmental evaluations are limited in the sense that conclusions are developed and information obtained from limited research and secondary sources. Except as set forth in this report, ATC has not made independent investigations as to the accuracy or completeness of the information derived from the secondary sources and personal interviews and has presumed that such information was accurate and complete. This report is intended for the sole use of the Town of St. Johnsbury. The scope of services performed in execution of this evaluation may not be appropriate to satisfy the needs of other users, and use or re-use of this document or the findings or conclusions is at risk of said user.

Additional information can be found in the attached **Appendix A,** sample location diagrams, and **Appendix B** contains the laboratory analytical results.

Thank you for selecting ATC for your environmental management needs. If you have any questions, please do not hesitate to call us at (802) 862-1980.

Sincerely,

ATC Group Services LLC.

CASE NARRATIVE SUMMARY

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

REVISED REPORT 12/5/16 - Project location updated per COC. Sample matrix types updated per chain of custody.

For method 680 PCB Homologs, Cl-10 is not reported or included in total PCB calculation due to the addition of this compound during initial preparation.

TO-10A/EPA 680 Modified

Qualifications:

V-06

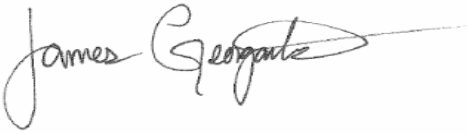
Continuing calibration did not meet method specifications and was biased on the high side for this compound. Increased uncertainty is associated with the reported value which is likely to be biased on the high side.

Analyte & Samples(s) Qualified:

Octachlorobiphenyls

B164275-BS1, B164275-BSD1

V-20



Continuing calibration did not meet method specifications and was biased on the high side. Data validation is not affected since sample result was "not detected" for this compound.

Analyte & Samples(s) Qualified:

Octachlorobiphenyls

16K1324-01[PCBV-1: Exterior], 16K1324-02[PCBV-2: 1st Floor], 16K1324-03[PCBV-3: Basement], 16K1324-04[PCBV-4: Field Blank], B164275-BLK1

The results of analyses reported only relate to samples submitted to the Con-Test Analytical Laboratory for testing.
I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

James M. Georgantas

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit
DL	Method Detection Limit
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
V-06	Continuing calibration did not meet method specifications and was biased on the high side for this compound. Increased uncertainty is associated with the reported value which is likely to be biased on the high side.
V-20	Continuing calibration did not meet method specifications and was biased on the high side. Data validation is not affected since sample result was "not detected" for this compound.

AIR Only Receipt Checklist

CLIENT NAME ATC Group Services RECEIVED BY: JM DATE: 11/23/16

1) Was the chain(s) of custody relinquished and signed? Yes ✓ No ✓ JM

2) Does the chain agree with the samples? Yes ✗ No ✓
If not, explain: Recieved 2 samples not on COC

3) Are all the samples in good condition? Yes ✓ No
If not, explain:

4) Are there any samples "On Hold"? Yes ✓ No Stored where:

5) Are there any RUSH or SHORT HOLDING TIME samples? Yes No ✓
Who was notified Date Time

6) Location where samples are stored:

Permission to subcontract samples? Yes No
(Walk-in clients only) if not already approved
Client Signature:

7) Number of cans Individually Certified or Batch Certified? N/A

Containers received at Con-Test

		# of Containers	Types (Size, Duration)
Summa Cans (TO-14/TO-15/APH)			
Tedlar Bags			
TO-17 Tubes			
Regulators			
Restrictors			
Hg/Hopcalite Tube (NIOSH 6009)			
(TO-4A/ TO-10A/TO-13) PUFs		6	Low Volume
PCB Florisil Tubes (NIOSH 5503)			
Air cassette			
PM 2.5/PM 10			
TO-11A Cartridges			
Other			

Unused Summas/PUF Media:

Unused Regulators:

1) Was all media (used & unused) checked into the WASP? N/A

2) Were all returned summa cans, Restrictors & Regulators and PUF's documented as returned in the Air Lab Inbound/Outbound Excel Spreadsheet? N/A

Laboratory Comments: 111716- 01,02,03,04,05,06

Any False statement will be brought to the attention of Client

Question	Answer (True/False) T/F/NA	Comment
1) The coolers'/boxes' custody seal, if present, is intact.	N/A	
2) The cooler or samples do not appear to have been compromised or tampered with.	T	
3) Samples were received on ice.	T	
4) Cooler Temperature is acceptable.	T	
5) Cooler Temperature is recorded.	T	
6) COC is filled out in ink and legible.	T	
7) COC is filled out with all pertinent information.	T	
8) Field Sampler's name present on COC.	T	
9) Samples are received within Holding Time.	T	
10) Sample containers have legible labels.	T	
11) Containers/media are not broken or leaking and valves and caps are closed tightly.	T	
12) Sample collection date/times are provided.	T	
13) Appropriate sample/media containers are used.	T	
14) There is sufficient volume for all requsted analyses, including any requested MS/MSDs.	T	
15) Trip blanks provided if applicable.	N/A	

Who notified of False statements? **Date/Time:**

Doc #278 Rev. 5 October 2014 **Log-In Technician Initials:** JM **Date/Time:** 11/23/16

CASE NARRATIVE SUMMARY

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

SW-846 8082A

Qualifications:

S-01

The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

Analyte & Samples(s) Qualified:

Decachlorobiphenyl
16K1272-07[PCB-16D], 16K1272-09[PCB-20C]

Decachlorobiphenyl [2C]
16K1272-07[PCB-16D], 16K1272-09[PCB-20C]

Tetrachloro-m-xylene
16K1272-07[PCB-16D], 16K1272-09[PCB-20C]

Tetrachloro-m-xylene [2C]
16K1272-07[PCB-16D], 16K1272-09[PCB-20C]

The results of analyses reported only relate to samples submitted to the Con-Test Analytical Laboratory for testing.
I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

Lisa A. Worthington

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit
DL	Method Detection Limit
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
S-01	The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

Sample Receipt Checklist

CLIENT NAME: ATC **RECEIVED BY:** RJM **DATE:** 11/28/16

1) **Was the chain(s) of custody relinquished and signed?** **Yes** X **No** ____ **No COC Incl.**

2) **Does the chain agree with the samples?** **Yes** X **No** ____
If not, explain:

3) **Are all the samples in good condition?** **Yes** X **No** ____
If not, explain:

4) **How were the samples received:**
On Ice X Direct from Sampling ____ Ambient ____ In Cooler(s) X

Were the samples received in Temperature Compliance of (2-6°C)? **Yes** X **No** ____ **N/A** ____

Temperature °C by Temp blank ____ Temperature °C by Temp gun 5.0

5) **Are there Dissolved samples for the lab to filter?** **Yes** ____ **No** X
Who was notified ____ Date ____ Time ____

6) **Are there any RUSH or SHORT HOLDING TIME samples?** **Yes** ____ **No** X
Who was notified ____ Date ____ Time ____

7) **Location where samples are stored:**

Permission to subcontract samples? Yes No
(Walk-in clients only) if not already approved
Client Signature: ____

8) **Do all samples have the proper Acid pH:** **Yes** ____ **No** ____ **N/A** X

9) **Do all samples have the proper Base pH:** **Yes** ____ **No** ____ **N/A** X

10) **Was the PC notified of any discrepancies with the CoC vs the samples:** **Yes** ____ **N/A** X

Containers received at Con-Test

	# of containers		# of containers
1 Liter Amber		16 oz amber	
500 mL Amber		8 oz amber/clear jar	
250 mL Amber (8oz amber)		4 oz amber/clear jar	
1 Liter Plastic		2 oz amber/clear jar	
500 mL Plastic		Plastic Bag / Ziploc	9
250 mL plastic		SOC Kit	
40 mL Vial - type listed below		Perchlorate Kit	
Colisure / bacteria bottle		Flashpoint bottle	
Dissolved Oxygen bottle		Other glass jar	
Encore		Other	

40 mL vials: # HCl ____ # Methanol ____ **Time and Date Frozen:**
Bisulfate ____ # DI Water ____
Thiosulfate ____ Unpreserved ____

Any False statement will be brought to the attention of Client

Question	Answer (True/False) T/F/NA	Comment
1) The cooler's custody seal, if present, is intact.	NA	
2) The cooler or samples do not appear to have been compromised or tampered with.	T	
3) Samples were received on ice.	T	
4) Cooler Temperature is acceptable.	T	
5) Cooler Temperature is recorded.	T	
6) COC is filled out in ink and legible.	T	
7) COC is filled out with all pertinent information.	T	
8) Field Sampler's name present on COC.	T	
9) There are no discrepancies between the sample IDs on the container and the COC.	T	
10) Samples are received within Holding Time.	T	
11) Sample containers have legible labels.	T	
12) Containers are not broken or leaking.	T	
13) Air Cassettes are not broken/open.	NA	
14) Sample collection date/times are provided.	T	
15) Appropriate sample containers are used.	T	
16) Proper collection media used.	T	
17) No headspace sample bottles are completely filled.	NA	
18) There is sufficient volume for all requsted analyses, including any requested MS/MSDs.	T	
19) Trip blanks provided if applicable.	NA	
20) VOA sample vials do not have head space or bubble is <6mm (1/4") in diameter.	NA	
21) Samples do not require splitting or compositing.	T

CASE NARRATIVE SUMMARY

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

SW-846 8082A

Qualifications:

H-06

Sample was extracted past the recommended holding time.

Analyte & Samples(s) Qualified:

16K1276-01[W-01], 16K1276-02[W-02], 16K1276-03[W-03], 16K1276-04[W-04], 16K1276-05[W-05], 16K1276-06[W-06], 16K1276-07[W-07], 16K1276-08[W-08], 16K1276-09[W-09], 16K1276-10[W-10], 16K1276-11[W-11], 16K1276-12[W-12]

S-01

The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

Analyte & Samples(s) Qualified:

Decachlorobiphenyl
16K1276-02[W-02], 16K1276-04[W-04]

Decachlorobiphenyl [2C]
16K1276-02[W-02], 16K1276-04[W-04]

Tetrachloro-m-xylene
16K1276-02[W-02], 16K1276-04[W-04]

Tetrachloro-m-xylene [2C]
16K1276-02[W-02], 16K1276-04[W-04]

The results of analyses reported only relate to samples submitted to the Con-Test Analytical Laboratory for testing.
I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

Lisa A. Worthington

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit
DL	Method Detection Limit
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
H-06	Sample was extracted past the recommended holding time.
S-01	The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

Sample Receipt Checklist

CLIENT NAME: ATC **RECEIVED BY:** RJM **DATE:** 11/23/16

1) **Was the chain(s) of custody relinquished and signed?** **Yes** X **No** ____ **No COC Incl.**
2) **Does the chain agree with the samples?** **Yes** X **No** ____
If not, explain:
3) **Are all the samples in good condition?** **Yes** X **No** ____
If not, explain:
4) **How were the samples received:**

On Ice X Direct from Sampling ____ Ambient ____ In Cooler(s) X

Were the samples received in Temperature Compliance of (2-6°C)? **Yes** X **No** ____ **N/A** ____

Temperature °C by Temp blank ____ Temperature °C by Temp gun 5.0

5) **Are there Dissolved samples for the lab to filter?** **Yes** ____ **No** X
Who was notified ____ Date ____ Time ____
6) **Are there any RUSH or SHORT HOLDING TIME samples?** **Yes** ____ **No** X
Who was notified ____ Date ____ Time ____
7) **Location where samples are stored:**

Permission to subcontract samples? Yes No
(Walk-in clients only) if not already approved
Client Signature: ____

8) **Do all samples have the proper Acid pH:** **Yes** ____ **No** ____ **N/A** X
9) **Do all samples have the proper Base pH:** **Yes** ____ **No** ____ **N/A** X
10) **Was the PC notified of any discrepancies with the CoC vs the samples:** **Yes** ____ **N/A** X

Containers received at Con-Test

	# of containers		# of containers
1 Liter Amber		16 oz amber	
500 mL Amber		8 oz amber/clear jar	
250 mL Amber (8oz amber)		4 oz amber/clear jar	12
1 Liter Plastic		2 oz amber/clear jar	
500 mL Plastic		Plastic Bag / Ziploc	
250 mL plastic		SOC Kit	
40 mL Vial - type listed below		Perchlorate Kit	
Colisure / bacteria bottle		Flashpoint bottle	
Dissolved Oxygen bottle		Other glass jar	
Encore		Other	

40 mL vials: # HCl ____ # Methanol ____ **Time and Date Frozen:**
Bisulfate ____ # DI Water ____
Thiosulfate ____ Unpreserved ____

(Rejection Criteria Listing - Using Sample Acceptance Policy)

Any False statement will be brought to the attention of Client

Question	Answer (True/False) T/F/NA	Comment
1) The cooler's custody seal, if present, is intact.	NA	
2) The cooler or samples do not appear to have been compromised or tampered with.	T	
3) Samples were received on ice.	T	
4) Cooler Temperature is acceptable.	T	
5) Cooler Temperature is recorded.	T	
6) COC is filled out in ink and legible.	T	
7) COC is filled out with all pertinent information.	T	
8) Field Sampler's name present on COC.	T	
9) There are no discrepancies between the sample IDs on the container and the COC.	T	
10) Samples are received within Holding Time.	T	
11) Sample containers have legible labels.	T	
12) Containers are not broken or leaking.	T	
13) Air Cassettes are not broken/open.	NA	
14) Sample collection date/times are provided.	T	
15) Appropriate sample containers are used.	T	
16) Proper collection media used.	T	
17) No headspace sample bottles are completely filled.	NA	
18) There is sufficient volume for all requsted analyses, including any requested MS/MSDs.	T	
19) Trip blanks provided if applicable.	NA	
20) VOA sample vials do not have head space or bubble is <6mm (1/4") in diameter.	NA	
21) Samples do not require splitting or compositing.	T

CASE NARRATIVE SUMMARY

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

SW-846 8082A

Qualifications:

MS-21

Matrix spike and/or spike duplicate recovery bias high due to contribution of other Aroclors present in the source sample.

Analyte & Samples(s) Qualified:

Aroclor-1016
B167254-MS1, B167254-MSD1

Aroclor-1016 [2C]
B167254-MS1, B167254-MSD1

Aroclor-1260
B167254-MS1, B167254-MSD1

Aroclor-1260 [2C]
B167254-MS1, B167254-MSD1

S-01

The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

Analyte & Samples(s) Qualified:

Decachlorobiphenyl
16L1356-01[PCB-CC-01A], 16L1356-02[PCB-CC-01B], 16L1356-03[PCB-CC-01C], 16L1356-04[PCB-CC-01D], 16L1356-05[PCB-CC-02A], 16L1356-06[PCB-CC-02B], 16L1356-13[PCB-CC-04A], 16L1356-17[PCB-CC-05A]

Decachlorobiphenyl [2C]
16L1356-01[PCB-CC-01A], 16L1356-02[PCB-CC-01B], 16L1356-03[PCB-CC-01C], 16L1356-04[PCB-CC-01D], 16L1356-05[PCB-CC-02A], 16L1356-06[PCB-CC-02B], 16L1356-13[PCB-CC-04A], 16L1356-17[PCB-CC-05A]

Tetrachloro-m-xylene
16L1356-01[PCB-CC-01A], 16L1356-02[PCB-CC-01B], 16L1356-03[PCB-CC-01C], 16L1356-04[PCB-CC-01D], 16L1356-05[PCB-CC-02A], 16L1356-06[PCB-CC-02B], 16L1356-13[PCB-CC-04A], 16L1356-17[PCB-CC-05A]

Tetrachloro-m-xylene [2C]
16L1356-01[PCB-CC-01A], 16L1356-02[PCB-CC-01B], 16L1356-03[PCB-CC-01C], 16L1356-04[PCB-CC-01D], 16L1356-05[PCB-CC-02A], 16L1356-06[PCB-CC-02B], 16L1356-13[PCB-CC-04A], 16L1356-17[PCB-CC-05A]

The results of analyses reported only relate to samples submitted to the Con-Test Analytical Laboratory for testing.
I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit
DL	Method Detection Limit
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
MS-21	Matrix spike and/or spike duplicate recovery bias high due to contribution of other Aroclors present in the source sample.
S-01	The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

Sample Receipt Checklist

CLIENT NAME: ATC **RECEIVED BY:** EB **DATE:** 12/29/16

1) **Was the chain(s) of custody relinquished and signed?** **Yes** ✓ **No** ____ **No COC Incl.**

2) **Does the chain agree with the samples?** **Yes** ✓ **No** ____
If not, explain:

3) **Are all the samples in good condition?** **Yes** ✓ **No** ____
If not, explain:

4) **How were the samples received:**

On Ice ✓ Direct from Sampling ____ Ambient ____ In Cooler(s) ✓

Were the samples received in Temperature Compliance of (2-6°C)? **Yes** ✓ **No** ____ **N/A** ____

Temperature °C by Temp blank ____ Temperature °C by Temp gun 4.4

5) **Are there Dissolved samples for the lab to filter?** **Yes** ____ **No** ✓
Who was notified ____ Date ____ Time ____

6) **Are there any RUSH or SHORT HOLDING TIME samples?** **Yes** ____ **No** ✓
Who was notified ____ Date ____ Time ____

7) **Location where samples are stored:** Log In

Permission to subcontract samples? Yes No
(Walk-in clients only) if not already approved
Client Signature: ____

8) **Do all samples have the proper Acid pH:** **Yes** ____ **No** ____ **N/A** ✓

9) **Do all samples have the proper Base pH:** **Yes** ____ **No** ____ **N/A** ✓

10) **Was the PC notified of any discrepancies with the CoC vs the samples:** **Yes** ____ **N/A** ✓

Containers received at Con-Test

	# of containers		# of containers
1 Liter Amber		16 oz amber	
500 mL Amber		8 oz amber/clear jar	
250 mL Amber (8oz amber)		4 oz amber/clear jar	
1 Liter Plastic		2 oz amber/clear jar	36 20
500 mL Plastic		Plastic Bag / Ziploc	
250 mL plastic		SOC Kit	
40 mL Vial - type listed below		Perchlorate Kit	
Colisure / bacteria bottle		Flashpoint bottle	
Dissolved Oxygen bottle		Other glass jar	
Encore		Other	

40 mL vials: # HCl ____ # Methanol ____ **Time and Date Frozen:**

Bisulfate ____ # DI Water ____

Thiosulfate ____ Unpreserved ____

CASE NARRATIVE SUMMARY

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

SW-846 8082A

Qualifications:

P-01

Result was confirmed using a dissimilar column. Relative percent difference between the two results was >40%. In accordance with the method, the higher result was reported.

Analyte & Samples(s) Qualified:

Aroclor-1260 [2C]
16L1357-01[PCB-CC-06A], 16L1357-02[PCB-CC-06B]

S-01

The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

Analyte & Samples(s) Qualified:

Decachlorobiphenyl
16L1357-05[PCB-CC-07A], 16L1357-06[PCB-CC-07B], 16L1357-07[PCB-CC-07C], 16L1357-08[PCB-CC-07D], 16L1357-09[PCB-CC-08E]

Decachlorobiphenyl [2C]
16L1357-05[PCB-CC-07A], 16L1357-06[PCB-CC-07B], 16L1357-07[PCB-CC-07C], 16L1357-08[PCB-CC-07D], 16L1357-09[PCB-CC-08E]

Tetrachloro-m-xylene
16L1357-05[PCB-CC-07A], 16L1357-06[PCB-CC-07B], 16L1357-07[PCB-CC-07C], 16L1357-08[PCB-CC-07D], 16L1357-09[PCB-CC-08E]

Tetrachloro-m-xylene [2C]
16L1357-05[PCB-CC-07A], 16L1357-06[PCB-CC-07B], 16L1357-07[PCB-CC-07C], 16L1357-08[PCB-CC-07D], 16L1357-09[PCB-CC-08E]

The results of analyses reported only relate to samples submitted to the Con-Test Analytical Laboratory for testing.
I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

Lisa A. Worthington

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit
DL	Method Detection Limit
MCL	Maximum Contaminant Level

Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.

No results have been blank subtracted unless specified in the case narrative section.

P-01	Result was confirmed using a dissimilar column. Relative percent difference between the two results was >40%. In accordance with the method, the higher result was reported.
S-01	The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

1.0 INTRODUCTION

This Targeted Brownfields Assessment (TBA) Report was prepared by KGSNE JV, LLC (KGSNE) for the United States Environmental Protection Agency (EPA) under contract EP-S1-17-01, Task Order No. 68HE0119F0009, Technical Direction Document No. BR-01-20-06-0001. This TBA Report documents the Hazardous Materials Building Survey (HBMS) conducted at the Former Armory Building located at 129 Main Street in St. Johnsbury, Vermont. A Site Locus Map is included as Figure 1.

The objective of this investigation is to identify hazardous building materials, mold, and regulated materials/universal wastes within the building. These results will be used to evaluate potential remedial actions and associated abatement costs. For this investigation, the entire building represents the sole Area of Concern (AOC).

KGSNE conducted Site activities and prepared this TBA Report in accordance with the EPA-approved Site-Specific Quality Assurance Project Plan Addendum (SSQAPPA) as prepared by KGSNE, (September 2, 2020). The TBA activities included surveys and sampling to locate, quantify, or otherwise determine the presence of the following:

- Asbestos containing materials (ACMs);
- Lead-based paint (LBP);
- Polychlorinated biphenyls (PCBs) in bulk building materials;
- Hazardous/regulated materials/universal wastes (survey only, no sampling); and
- Mold/fungi.

1.1 Key Team Members

Jim Byrne is the EPA Task Order Project Officer (TOPO). The Brownfield Grantee is the Town of St. Johnsbury. Tim Andrews managed KGSNE and subcontractor tasks, and Gary Glennon coordinated with the analytical laboratories and managed data review activities. Josh Stewart implemented field activities as the Field Operations Leader (FOL).

EMSL Analytical, Inc. (EMSL) located in Woburn, Massachusetts, performed the asbestos analysis. Eastern Analytical, Inc. (EAI) performed the PCB Analysis. The mold sampling and analysis was performed by Environmental Compliance Associates, LLC (ECA). Lead-Based Paint

(LBP) testing was performed by Vermont-licensed Lead Inspector/Risk Assessor John Madigan with KD Associates.

1.2 Site Background

The Former Armory building is a 2-story 5,600 (+/-) square foot building that was constructed in 1916. The building has served as an armory, gymnasium, and meeting house over the years. The building has remained vacant and unconditioned for several years, leading to extensive mold growth and damage to various building materials. The building floorplans are included as Figures 2A through 2C.

1.3 Contaminants of Concern

Potential contaminants of concern (COCs) in building materials include asbestos, lead paint, PCBs, and mold.

1.4 Document Review

KGSNE reviewed the Environmental Survey report completed by ATC on March 28, 2013 to determine which materials have been previously sampled and identified as ACM. A Copy of the report is included as Appendix A. KGSNE sampled additional materials that were suspect as ACM to adequately characterize the building in preparation for demolition activities to comply with EPA NESHAP and the Vermont Regulations for Asbestos Control (VRAC).

2.0 TBA SITE INVESTIGATION ACTIVITIES

KGSNE performed the hazardous building materials survey on February 2, 2021 and February 3, 2021. Christopher Clement, CIH (Vermont-licensed Asbestos Site Inspector #MP032436) performed the asbestos and mold surveys and sampling. Josh Stewart performed the hazardous material (HM) inventory and PCB sampling. John Madigan (Vermont-licensed Lead Inspector), with KD Associates, was subcontracted by KGSNE to conduct the United States Occupational Safety and Health Administration (OSHA) pre-demolition LBP survey on February 2, 2021.

A floor plan depicting the building layout and assigned room numbers is included as Figures 2A through 2C. Photographs from the survey are included as Appendix B. Inspection findings are presented in the following sections.

2.1 Asbestos Containing Materials (ACM)

State and federal regulations require that inspectors collect multiple samples from homogeneous areas to identify asbestos content in suspect ACM. Homogeneous areas consist of areas that appear to be similar in material color, texture, and date of installation or application. KGSNE collected 45 samples of suspect ACM for laboratory analysis to characterize building materials in identified homogeneous areas.

Previous analytical testing identified plaster walls and ceilings, AirCell pipe insulation and mudded joint fittings as ACM. These materials were not resampled by KGSNE during this assessment. Bulk samples that tested positive for the presence of asbestos are presented in Table 1. Bulk samples that returned negative results for the presence of asbestos are presented in Table 2.

Bulk samples were transmitted under a chain-of-custody to EMSL Analytical, Inc., an accredited Vermont-certified laboratory located at 5 Constitution Way, Unit A in Woburn, Massachusetts. Samples were analyzed by polarized light microscopy (PLM) in accordance with the EPA “Method for Determination of Asbestos in Bulk Material”; EPA/600/R-93/116 (July 1993). Laboratory analytical data for asbestos sampling is included as Appendix C.

Bulk samples collected from each homogeneous area were analyzed using the “hit-stop” procedure. Per this procedure, additional analysis of duplicate samples collected from identical homogeneous areas is not required if asbestos is detected in any one of the samples from the homogeneous group. A total of 45 bulk samples of suspect ACM were analyzed by PLM during this sampling event (no samples were omitted by the hit-stop procedure).

The PLM analysis method sometimes has difficulty identifying asbestos in non-organically bound (NOB) materials (floor tile, caulking, roof tar) since the opaque material binder can impede visual estimation of fibers. Transmission Electron Microscope (TEM) analysis is often used to confirm analytical results of NOB materials that tested negative for asbestos by the PLM analytical

method. KGSNE submitted 7 samples of NOB materials for TEM analysis to confirm PLM analytical results. Asbestos was not detected in the samples submitted for TEM analysis.

In addition, the following materials are assumed to contain asbestos:

- Any foundation damp proofing encountered below ground surface during demolition.
- Any lining or insulation materials identified behind the brick façade.
- Boiler internals (interior gaskets and insulation).

Additional limitations are presented in Section 2.6 below. Assumed ACM should be abated as ACM or tested when demolition allows for sampling and access to materials.

2.2 Lead Based Paint (LBP)

Vermont Lead Inspector John Madigan performed an OSHA pre-demolition lead survey on interior and exterior painted building components to identify materials that contain LBP. This LBP determination was conducted using X-ray Fluorescence (XRF) that non-destructively tests building components for the presence of lead.

Lead screening results are used to calculate worker exposure levels for OSHA compliance and to assess lead levels for proper handling and disposal of building materials during demolition or renovation. Screening results also provide an indication of the concentration of lead likely to be present in the abatement/demolition waste stream and identify lead concentrations with regards to future occupant safety. The lead-based paint survey was based on EPA protocols and United States Department of Housing and Urban Development (HUD) guidance and acceptable practices adopted for inspecting for LBP.

Building components returning results greater than 1.0 mg/cm^2 include all window components, stair risers, concrete floor paint, brick walls and ceilings, metal doors and ceilings, plaster walls, wood columns, and wood porch trim. Refer to Table 3 for positive LBP screening results. The Lead Inspection Report is included in Appendix D.

Per EPA and HUD regulations, LBP is present on any surface containing lead equal to or greater than 1.0 milligrams per square centimeter (mg/cm^2); however, the OSHA Lead Construction Standard,

Chapter 29, Section 1926.62 of the Code of Federal Regulations (29 CFR 1926.62) regulates worker exposure at any lead concentration. Based on current OSHA regulations, any painted surfaces containing lead at levels above 0.0 mg/cm^2 that will be disturbed during demolition activities must be handled as lead containing/LBP.

2.3 Polychlorinated Biphenyls (PCBs)

KGSNE collected five (5) samples of building materials laboratory analysis of PCBs. The materials sampled included floor paper, tar, and paint. Sampling was performed by removing a minimum of 10 grams of suspected PCB-containing media from building components to accurately determine the concentration of PCBs. Eastern Analytical Inc. (EAI) in Concord, New Hampshire analyzed PCB samples by SW-846 Method 8082 using the Soxhlet extraction method (SW-846 3540C).

Gym floor paper, hardwood subfloor paper, light pink paint, and light blue paint were identified to contain levels of PCBs at concentrations above the Toxic Substances Control Act (TSCA) cleanup standard of 1.0 ppm for high occupancy areas. Additionally, samples collected by ATC in 2013 indicated grey door caulking, white window caulking, white wall paint, and blue floor paint were also detected above the TSCA cleanup standard of 1.0 ppm for high occupancy areas.

Building materials with total PCB concentrations greater than 50 ppm present in a high occupancy use area must be removed and disposed of as a TSCA regulated PCB waste. Grey floor paint sampled by ATC was detected at a concentration of 5,700 ppm, which exceeds the 50-ppm limit. This material will require EPA notification, and removal and disposal will need to be performed in general accordance with TSCA regulated waste.

Table 4 summarizes PCB analytical results. PCB analytical laboratory reports are included as Appendix E.

In addition, fluorescent light ballasts may contain PCB oils. KGSNE observed PCB-containing light ballasts and other ballasts labeled with a “no-PCBs” designation during the HM inventory. Therefore, hazardous materials removal contractors should consult labels on each fluorescent light ballast during removal to confirm if ballasts contain PCBs. The fluorescent light ballast tally is included in the HM survey results section below.

2.4 Hazardous/Regulated Materials

KGSNE surveyed the building for regulated materials, universal waste, and miscellaneous hazardous materials. Hazardous/regulated materials encountered during the survey include fluorescent light tubes, fluorescent light ballasts, standalone lead acid batteries and in emergency lights and exit signs, fire extinguishers, refrigerator/freezer, and microwave. The hazardous materials inventory is presented in Table 5.

Additional hazardous materials (oils, gaskets, packing, insulation, mercury switches, etc.) may be located inside equipment, components, controls, and switches. If needed, a qualified technician should dismantle equipment and remove internal hazardous materials prior to component disposal.

2.5 Mold

ECA collected 9 spore trap air samples and 10 surface samples using tape-lift method from various surfaces throughout the building. Spore Trap Samples were collected onto Micro5™ spore trap cassettes. The samples were collected using high flow sampling pumps. In general, air is sampled at a rate of 5 liters per minute (lpm) through the Micro5™ cassettes for 5 minutes, totaling 25 liters. Upon receipt by the laboratory, the slide is removed from the cassette for the enumeration and identification of fungal spores. The deposition trace is analyzed at 400-800X magnification using Kohler Illumination.

Surface samples are collected by adhering a strip of clean, invisible tape directly to a surface/substrate and mounting it on a standard microscope slide for direct microscopic examination. Surface samples are helpful in determining what types of mold are present, whether growth is occurring on seemingly clean surfaces, and the extent of contamination of interior substrates.

Because of the ubiquity of fungi, samples collected from suspect areas need to be evaluated against samples collected from the outdoors and non-suspect areas for comparison. In general, the genus of fungi collected from the indoor air should be like those found outdoors and should contain similar concentrations. Significantly higher concentrations of fungi of different genera can indicate a mold problem in the indoor environment.

EPA has not set standards or threshold limit values for mold since fungal spores are ubiquitous and mold background levels vary greatly by region, season, and location. In addition, mold health

hazards and mold sensitivity vary with mold types, exposure levels, and the susceptibility an individual (i.e., genetic predisposition, age, pre-existing medical conditions, etc.), often making it difficult to identify dose/response relationships that are required to establish “safe” or “unsafe” levels (i.e., permissible exposure limits).

Laboratory analysis identified several mold and fungal species of varying concentrations including aspergills/penicillium, basidiospores, Cladosporium, Chaetomium, and Stachybotrys. Mold surface sample results are summarized on Table 6 and mold air sampling results are summarized on Table 7. The mold analytical report is included in Appendix F.

2.6 Survey Limitations

This report is subject to the limitations included in Appendix G. In addition, the following limitations were encountered during the inspection due to the condition of the on-site building or for other safety reasons:

- KGSNE attempted to characterize all building materials in the inspection area; however, it is impractical and costly to sample all materials in all areas. Inspection regulations are based on representative sampling. KGSNE collected representative samples from suspect asbestos and PCB-containing materials observed throughout the building.

- KGSNE did not observe foundation damp proofing on concrete foundations during the inspection; however, it was beyond the scope to core through pavement abutting the building or excavate soil adjacent to foundations.

- Building supplies and specialized equipment (cleaning agents, building materials, viable equipment, etc.) are not included in the hazardous waste inventory as these items are likely to be retained/relocated prior to renovation.

- Additional sampling or analysis of air, soil, water, or any other regulated or hazardous materials was beyond the scope of the HBMS.

3.0 CONCLUSIONS AND RECOMMENDATIONS

KGSNE completed the hazardous materials survey on February 2 and 3, 2021. The objective was to identify building materials containing ACM, LBP, and PCBs, and to inventory universal and/or regulated wastes to determine safety, abatement, and disposal requirements prior to renovation and/or demolition activities.

3.1 ACM

Materials identified as ACM are presented in Table 1 and include plaster walls and ceilings, AirCell pipe insulation and mudded joint fittings. Bulk samples that returned negative results for the presence of asbestos are presented in Table 2.

Asbestos abatement must be conducted in accordance with the Vermont Department of Health VSA Title 18, Chapter 26, Vermont Regulations for Asbestos Control.

Abatement activities must be conducted in accordance with Federal, State, and local regulations and protocols, and by a certified asbestos abatement contractor. A Vermont-certified Asbestos Project Monitor must provide abatement oversight, background/ambient air sampling, a final visual inspection, and final clearance air sampling during and at the completion of abatement activities.

3.2 LBP

Building components returning results greater than 1.0 mg/cm^2 are presented in Table 3 and include all window components, stair risers, concrete floor paint, brick walls and ceilings, metal doors and ceilings, plaster walls, wood columns, and wood porch trim.

LBP demolition/renovation is required to be performed by a contractor in compliance with the OSHA Rules for Occupational Health and Environmental Controls for Lead 29 CFR 1926.62, including implementation of a written worker protection program, personal air monitoring, and respiratory protection program.

Although EPA has established a 1.0 mg/cm^2 (0.5% by dry weight) threshold value for dangerous levels of lead, OSHA has not. The OSHA Lead Standard has no set limit for LBP concentrations

below which the standards do not apply (i.e. – OSHA considers any paint with detectable lead concentrations to be LBP).

If contractors are working with any levels of LBP, they must comply with exposure assessment criteria, worker protection, and other regulatory requirements until air sampling or historical data proves otherwise, regardless of concentration. LBP abatement may be required prior to working with, dismantling, or otherwise handling materials coated with LBP. A phased demolition plan could be implemented based on project specifications to save costs and possibly eliminate LBP abatement requirements.

During demolition, representative samples of LBP waste generated should be collected for toxicity characteristic leaching procedure (TCLP) lead analysis in accordance with 40 CFR Part 261 prior to material disposal. Under the Resource Conservation and Recovery Act (RCRA), the “acceptable” level of lead (i.e., not hazardous waste) in demolition debris is 5 milligrams per liter (mg/L) by TCLP. If demolition debris exceeds 5 mg/L of lead by TCLP, it must be disposed of as hazardous waste. Sampling and TCLP analysis of materials with low to mid-range XRF results may be used to establish lower limits under which materials can be disposed of as non-hazardous waste. If metal building components are to be recycled, lead abatement may not be necessary. Cleanup protocols for LBP vary based on intended building reuse (i.e., residential vs industrial).

3.3 PCBs

KGSNE identified PCB concentrations above the TSCA cleanup standard of 1.0 ppm in samples collected from gym floor paper, hardwood subfloor paper, light pink paint, light blue paint, grey door caulking, white window caulking, white wall paint, and blue floor paint. PCB analytical results are presented in Table 4.

Federal TSCA regulations establish remediation and disposal requirements for hazardous wastes with total PCB concentrations greater than 50 ppm. TSCA hazardous wastes are either classified as PCB bulk product waste or PCB remediation waste, and generally PCB-containing building materials are considered as a bulk product waste. EPA defines PCB bulk product waste as waste derived from products manufactured to contain PCBs in a non-liquid state at 50 ppm or greater (e.g., caulk, paint, mastics, and sealants). Grey floor paint was detected at a concentration of 5,700

ppm, which exceeds the 50-ppm limit. This material will require EPA notification, and removal and disposal will need to be performed in general accordance with TSCA regulated waste.

In 2013, EPA clarified the meaning of TSCA “Excluded PCB Products” to deemphasize the regulation of commercial products containing low concentrations of PCBs. Excluded products include materials legally installed before October 1, 1984, products legally manufactured and used pursuant to authority granted by EPA, and materials where the resulting PCBs concentration is not the result of diffusion, leaks, or spills of PCBs in concentrations over 50 ppm. However, the burden of demonstrating that a regulatory exclusion applies rests with the party seeking that exclusion.

The disposal contractor should perform additional investigations to determine if materials with PCB concentrations greater than 1 ppm, but less than 50 ppm are a TSCA Excluded PCB Product as defined in 40 CFR Part 761.3 and are therefore unregulated.

If the material is deemed an excluded product and unregulated, removal may not be required. If PCB -containing components are to be removed, proper handling of PCB-containing materials by appropriately trained workers is still required and waste must be disposed of at a facility permitted to accept PCB-containing materials at the concentrations present. These materials should be evaluated by the demolition/disposal contractor and the receiving facility to identify any disposal limitations prior to material removal.

If the PCB-containing material is not an excluded product, it is regulated under TSCA and special handling, disposal, and regulatory compliance are required. Surrounding substrates such as brick, cement block, and cement may also be subject to special handling and disposal if PCBs have leached into these building components at concentrations greater than 1 ppm and remediation of adjacent materials such as soil may also be necessary if PCB-containing materials have degraded and cross-contaminated the surroundings. Additional testing should be performed on substrates to which the PCB-containing material was adhered and on surrounding material to delineate PCB leaching and cross contamination if a product is not excluded from TSCA regulations.

3.4 Hazardous Materials Inventory

Regulated materials and universal wastes encountered during the survey include fluorescent light tubes, fluorescent light ballasts, lead acid batteries, fire extinguishers, refrigerator/freezer, and a microwave. The hazardous materials inventory is presented in Table 5.

Hazardous materials that may require special handling and disposal should be removed from the building prior to renovation/demolition. Materials handling, transport, and recycling or disposal should be in accordance with applicable Federal, State, and local laws and regulations.

Hazardous materials removal contractors should consult labels on each fluorescent light ballast during removal to confirm if ballasts contain hazardous waste. Fluorescent light ballasts labeled as non-PCB containing may contain diethylhexyl phthalate (DEHP). DEHP was the primary substitute to replace PCBs for small capacitors in fluorescent lighting ballasts and is a toxic substance and a suspected carcinogen. Superfund liability exists for landfilling of DEHP-containing ballasts; therefore, the disposal contractor should avoid disposing of DEHP containing ballasts in the general waste stream. Non-PCB ballasts should be disposed of via metals recycling and incineration.

3.5 Mold

Mold samples were found to contain significantly elevated concentrations of mold in the air, as well as heavy to moderate mold growth on surfaces. Mold results are included on Tables 6 and 7. All mold types may cause health symptoms. Generally, mold health hazards increase as mold spore counts increase. Fruiting structures (active mold) also increase mold health hazards; therefore, high spore counts, fruiting structures, and toxigenic molds should be considered the most hazardous. Indoor fungal growth is undesirable, and measures should be taken to eliminate mold.

Mold is very common in buildings and homes and will grow where there is moisture. Although mold is ubiquitous, the Center for Disease Control recommends that molds be removed from buildings. Toxigenic mold should be eliminated; however, mold cannot be eliminated or controlled until the moisture source is eliminated. Personnel working in mold infested areas should don worker protection such as respirators and Tyvek suits until air sampling or mold sampling data proves mold is no longer a hazard or until mold is removed.

Building demolition will not likely require mold abatement; however, building renovation will require mold removal. If possible, moldy building components should be cleaned or removed during renovation; however, widespread mold growth identified on materials throughout the building may be too intrusive for cleaning and would require material removal to eliminate mold hazards.

Based on building conditions, KGSNE does not recommend reuse of non-structural building components contaminated with mold, as the removal of organic based building materials is the best method to eliminate mold. Surfaces that are metal, concrete, and plaster can be cleaned with an agent to remove the mold, depending on the physical condition of the building material. Conditions such as water leaks, condensation, and flooding must be corrected to prevent mold regrowth.

3.6 Abatement Costing

Table 8 provides a preliminary cost estimate based on prevailing wage rates for abatement and disposal of hazardous and regulated wastes identified in accessible building areas. The disposal contractor should verify hazardous material locations, quantity, and disposal costs before conducting removal activities. Actual abatement and disposal costs may vary and are strongly influenced by abatement contractor availability, the building reuse determination, building design, and the selection of demolition or renovation.

Encapsulation and management of ACM, LBP, and PCBs do not appear to be viable options in this case due to extensive damage to building materials throughout the building. Additional costs should be anticipated for the disposal of hidden and/or miscellaneous items found throughout the building during demolition/renovation. Additional cost should be carried for engineering planning and oversight (i.e., industrial hygiene costs). KGSNE considered the following while generating the cost estimates:

- Abatement cost estimates are based on unit costs provided by New England based abatement contractors providing typical in-type abatement and disposal services.

- While addressing lead and mold may not produce a hazardous waste stream that requires management and disposal, LBP and mold should be addressed in accordance with OSHA regulations for worker safety. KGSNE has included costs for LBP abatement/preparation prior to torch cutting for worker safety. Lead abatement may not be necessary if the

selected method of demolition does not create a lead hazard for demolition personnel (e.g., crushing vs torch cutting).

- LBP and mold abatement costs are heavily dependent on plans for re-use (lead and mold may only have to be abated if the buildings are to be renovated), and renovation and demolition plans and should be reviewed by a licensed lead paint and mold abatement contractors after final reuse is determined. In many instances, it is more cost effective to remove and dispose of non-structural components contaminated with mold and LBP rather than to perform abatement and reuse these materials.

- Abatement of PCB contaminated materials is not included in the abatement estimate. Costing is highly dependent on means and measures. Consult an abatement contractor for actual pricing.

4.0 DATA USABILITY AND VALIDATION

KGSNE performed an EPA Region 1 Tier I Plus data validation on the PCB analytical data. The data validation memorandum is included in Appendix H. The data review was completed in accordance with the *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (June 2018); *USEPA National Functional Guidelines for Superfund Organic Methods Data Review* (January 2017); *USEPA National Functional Guidelines for Superfund Inorganic Methods Data Review* (January 2017); and the SSQAPPA.

EAI performed the requested analyses in conformance with the established planning documents.

Data validation indicates that the data meets the project quality criteria and that the results can be used without restriction. Based on this determination, these results are considered usable for decision making.

Table 8
Abatement Cost Estimate
Former St. Johnsbury Armory
St. Johnsbury, VT

Material	Location	Quantity	Units	Price Per Unit	Disposal Cost Estimate
ACM					
Wall/Ceiling Plaster	Throughout	12,500	SF	$ 5.00	$ 62,500.00
Air Cell Pipe Insulation	Room 27 Basement	100	LF	$ 22.00	$ 2,200.00
Mudded Joint Packing	Room 27 Basement	10	LF	$ 30.00	$ 300.00
Boiler Internals	Basement Northeast	1	EA	$ 5,000.00	$ 5,000.00
				Subtotal	**$ 70,000.00**
LBP					
Lead abatement/preparation prior to torch cutting for worker safety [8]		3	EA	$ 30,000.00	**$ 90,000.00**
					$ 90,000.00
Regulated/Hazardous Materials					
Fluorescent Bulbs (4')	Throughout	650	LF	$ 0.10	$ 65.00
Compact Fluorescent and Halogen Bulbs	Throughout	30	EA	$ 5.00	$ 150.00
Ballasts (No PCB Type)	Throughout	40	EA	$ 15.00	$ 600.00
Ballasts (PCB)	Basement	66	EA	$ 30.00	$ 1,980.00
Batteries (Emergency lights and exit signs)	Throughout	30	lb	$ 5.00	$ 150.00
Batteries (Automotive)	Basement Hallway	1	EA	$ 50.00	$ 50.00
				Subtotal	**$ 2,995.00**
			Grand Total (Does Not Include Lead Costs)		**$ 72,995.00**
			Grand Total (Inculding Lead Cost)		**$ 162,995.00**

Notes:

1. Hazardous materials inventory does not include chemicals (cleaners, oils, fuels, etc.) or equipment and appliances (TVs, refrigerators, AC units, etc.) as they are likely to be removed from the building prior to renovation.
2. Disposal cost for ballast assumes that all ballasts are "No PCB" type ballasts, as PCB containing ballasts were not observed during the survey. If PCB ballasts are encountered during renovation, disposal costs would be $30/ea. Disposal contractor is responsible for confirming PCB content of light ballasts.
3. ACM and Hazardous Materials inventory does not include materials located in inaccessible sections of the building.
4. Emergency light and exit sign battery disposal costs are calcualted assuming that each battery weighs 2 pounds. Automotive battery disposal costs assumes labor charge for removal and transport and that batteries are recycled (no disposal charge or credit given).
5. Quantities established from field calculations or Town-provided drawings.
6. Some quantities are estimated or rounded up to provide a conservative abatement cost.
7. Price per unit rates are prevailing wage rates.
8. Lead abatement cost is for OSHA worker safety compliance. Lead abatement may not be necessary if the selected method of demolition does not create a lead hazard for demolition personnel (e.g. crushing vs torch cutting). Nobis assumes up to 3 major structures will require lead abatement prior to torch cutting to dismantle structures to be demolished.
9. Cost for areas with multiple layers of ACM were calculated seprately for each layer.
10. PCBs are not included in this estimate, TSCA level PCBs require sepcial handing and disposal. Non-TSCA level PCBs may also require special handling and disposal. Contact an abatement contractor for costing.
11. Mold abatement is not included in this estimate. Mold abatement may be required for renovations, contact an abatement contractor for abatement costing.

1.0 BACKGROUND

The following report documents the asbestos, polychlorinated biphenyls (PCBs), lead based paint (LBP), lead in dust, indoor air quality (IAQ), drain sediment sampling performed at the former Saint Johnsbury Armory facility, located at 1249 Main Street (the site) in Saint Johnsbury, Vermont. In addition the report documents the dye-testing results of the basement floor drain system.

The site is currently developed with the former St. Johnsbury Armory building, a three story masonry structure. The building is currently vacant and is located on an approximately 0.44 acre parcel. The property is located in downtown St. Johnsbury in an area with mix-use development. The property is located on the west side of Main Street and is bounded on the north and west by the Saint Andrews Episcopal Church and the Grace Methodist Church, respectively; a dentist's office to the south and to the east, across Main Street is the Passumpsic Savings Bank and several other small business'.

Pursuant to the Phase I Environmental Site Assessment (May 2012, the Johnson Company), the property has been developed since at least 1882, originally with four separate buildings. Apparently the current armory building was constructed circa 1916. Modern uses of the building include use by the St, Johnsbury Police Department, the American Red Cross and the St. Johnsbury Parks and recreation Department. The Phase I indicates that the Vermont National Guard last occupied the building in 1976.

Cardno ATC understands that the Saint Johnsbury History and Heritage Center is assessing the feasibility for redevelopment of the building into a possible office headquarters, education and museum space.

This US EPA Brownfields project was completed by Cardno ATC for the Northeastern Vermont Development Association (NVDA) and pursuant to the approved Site Specific Quality Assurance Project Plan (SSQAPP) Addenda F-1 dated November 28, 2012. The Scope of Work for this project as outlined in the SSQAPP was based on the findings of the Phase I Environmental Site Assessment completed for the site in May of 2012 (prepared by the Johnson Company).

2.0 FINDINGS

2.1 ASBESTOS SURVEY

Pursuant to the SSQAPP, all asbestos samples were collected pursuant to the Cardno ATC SOP F-SOP-1.12. This *baseline* asbestos survey was also conducted pursuant to ASTM method E2356-04 "Standard Practice for Comprehensive Building Asbestos Surveys". Samples were submitted to the Cardno ATC Asbestos Laboratory Division (NY, NY) for laboratory analysis via polarized light microscopy (PLM) analysis.

A *Baseline Survey* is a building-wide or facility wide inspection that provides a general sense of the overall location, type, quantity and conditions of asbestos –containing materials (ACM) present. The baseline survey provides information for long-term management of ACM and prioritization of response actions, however a baseline survey is unobtrusive in that walls and other barriers are not damaged (opened up) in order to collect samples. Therefore, it is possible that suspect ACM may be located behind walls other barriers (such as inside boilers, doors, etc.).

Previous asbestos sampling data from Crothers Environmental Group LLC's "Limited Interior Asbestos Inspection" report Dated November 1, 2008 was utilized and sampling data from the 2008 report was incorporated into this report. The fieldwork was conducted by Cardno ATC on December 10, 17, 18 and 28, 2012.

Asbestos bulk samples were analyzed by Polarized Light Microscopy (PLM). Asbestos Containing Material (ACM) is defined as material that contains any type of asbestos in an amount greater than 1% asbestos.

The following building materials were identified as ACM from this survey:

- **Air cell pipe insulation (Homogenous Material No. 24 [H 24])**
- **Mudded joint packings (H42)**

The following materials were found to previously be identified as ACM within the previous 2008 survey:

- **Plaster walls and ceilings (H11)**

The following materials have not been sampled (due to inaccessibility) and should be assumed to be ACM:

- **Door Insulation (H15)**
- **Fire Brick (H26)**
- **Vibration Cloth (H34)**
- **Boiler Door Insulation (H37)**
- **Boiler Internal Materials (H43)**

The following materials were found to contain trace amounts (<1%) of asbestos:

- **Exterior Window Caulking (H4)**
- **Exterior Tar Brick Caulking (H5)**

Appendix A of this report contains a listing of suspect asbestos containing materials, a sample location diagram and the asbestos laboratory hardcopy results.

2.1.1 Asbestos Quality Assurance/Quality Control

For the purposes of comparing duplicate samples, samples 01A and 01B (duplicate) were utilized. Both samples were below were below laboratory detection limits. Laboratory in-house QA/QC included duplicate analysis of 10% of samples by the original analyst as well as a duplicate analysis by a second analyst (recounts). All QA/QC laboratory recounts passed QA/QC requirements; the Data Entry sheet for the asbestos bulk sample laboratory recounts is included with the laboratory hardcopy results in **Appendix A**.

2.1.2 Asbestos Recommendations

- Prior to any renovations/demolition to the building, any asbestos containing materials that may be disturbed must be removed or abated as required (per State and Federal regulations).

- Suspect ACM may be enclosed or concealed in areas Cardno ATC did not access during this survey. If suspect materials that are not included in this survey are discovered during renovation / demolition activities, they shall be tested prior to disturbance.

- Materials containing “trace” amounts of asbestos (<1%) are not considered Asbestos Containing Materials (ACM) by the US EPA and many state agencies. However, certain sections of OSHA standard 29 CFR 1926.1101 apply when such materials are subject to disturbance. Refer to “OSHA Standard Interpretation and Compliance Letter” dated 8/13/1999, subject: “Requirements for demolition operations involving material containing <1% asbestos”.

- Asbestos abatement activities must be performed by a Vermont certified abatement contractor following all applicable State and Federal regulations. Abatement activities should be designed by a Vermont certified asbestos project designer and overseen by a Vermont certified asbestos project monitor.

2.2 PCB IN BUILDING MATERIALS SURVEY

Pursuant to the SSQAPP, all PCB samples were collected pursuant to the Cardno ATC SOP F-SOP-1.17. Samples were submitted to EMSL Analytical, Inc. (Cinnaminson, NJ) for laboratory analysis via 3540C/8082A analysis. PCB bulk samples of suspect materials (oil paints, caulking or similar elastic sealant materials installed prior to 1978) were collected; a minimum of two bulk samples representative of each different homogeneous area of suspect material sampled were collected.

Cardno ATC visually inspected accessible areas of the facility for homogeneous groupings of suspect PCB containing materials. Only suspect (window and door caulking, paint, expansion joints etc.) materials installed prior to 1978 were investigated. Cardno ATC sampled ten (10) materials that are considered to be suspect for containing PCB's.

The EPA regulatory limit ("not authorized for use" under the Toxic Substances Control Act of 1976 [TSCA]) for PCBs in building materials is 50 parts per million (ppm).

The gray floor paint in the basement level (H16) was the only material identified during this survey as containing levels of PCBs in excess of 50 ppm. The PCB content of the gray paint was identified as containing levels up to 5,700 ppm.

Appendix B of this report contains a listing of suspect PCB materials, a PCB sample location diagram and PCB laboratory hardcopy results.

2.2.1 PCB Quality Assurance/Quality Control

Pursuant to the SSQAPP one duplicate PCB sample was collected. Sample number 16C (grey floor paint, H16) is a duplicate of sample number 16B (as well as 16A). The Relative Percent Difference (RPD) between samples 16B (5,600 ppm) and 16C (4,600) is 21%, which is within the RPD requirement of 50% pursuant to the SSQAPP. The RPD between samples 16A and 16C is 0%.

2.2.2 PCB Recommendations

- Additional PCB sampling should be conducted to determine to what extent, if any, of the PCBs from the flooring paint have leached into the concrete floor substrate. Required removal of PCB materials (such as the flooring paint) must be conducted pursuant to TSCA and may require an EPA approved work plan.

2.3 LEAD BASED PAINT XRF SURVEY

Pursuant to the SSQAPP, the XRF lead based paint (LBP) Survey was conducted pursuant to the Cardno ATC SOP F-SOP-1.19. The LBP XRF survey of the building was conducted on December 10 and 17, 2012. Lead based paint is defined as paint or other surface coatings that contain lead equal to or greater than 1.0 mg/cm^2 (by XRF).

A lead paint analyzer (XRF) was used to sample representative painted components and surfaces for lead content. The following **Table 1** summarizes the various components identified as LBP.

Table 1: Summary of XRF Lead in Paint Results						
Component	***Room No.***	***Condition***	***Substrate***	***Color***	***Location in Room***	***Result (mg/cm^2)***
Windows – All Components	Exterior	Good - Poor	Wood	White	All	>9.9 (maximum reading of instrument)
Side Porch	Exterior	Good	Wood	White	D side	3.0
Window Wells	Throughout Building	Good - Poor	Wood	White	All	>9.9 (maximum reading of instrument)
Wall	Room 21	Good	Brick	Blue	C side	3.0
Door	Room 21	Good	Metal	Green	C side	3.4
Floor	Throughout Basement	Fair - Poor	Concrete	Grey	All	1.5
Walls and Ceiling	Room 23	Good - Fair	Brick	Green	All	1.5
Walls	Room 24	Good - Poor	Brick	Green	All	3.0
Walls	Room 25	Good	Brick	White	All	3.0
Stair Riser	Room 25	Good	Wood	White	A side	1.1

Individual room by room testing results are contained on the field sheets included in **Appendix C** of this report.

2.3.1 Lead in Paint Quality Assurance/Quality Control

Pursuant to QA/QC procedures within the Cardno ATC SOP (F –SOP-1.19), QA/QC repeat testing was conducted on ten (10) surfaces. A procedure for calculating the retest tolerance limit is specified in the XRF instrument Performance Characteristic Sheet (PCS). The retest conducted by Cardno ATC was within the tolerance limit for the instrument.

Appendix C contains the room location diagram, field sheets, XRF instrument protocol, the repeated testing (QA/QC) results, and the PCS.

2.3.2 Lead in Paint Recommendations

- If Demolition/Renovation activities are planned that would disturb finish coatings, then appropriate work practices should be employed to satisfy the Lead in Construction OSHA Standard (1926.62), including but not limited to representative air monitoring to determine actual employee exposures.
- Copies of this report should be provided to the general contractor and demolition contractor to assist with compliance to VOSHA Lead in Construction Standard.
- Any abatement of lead hazards must be completed by a Vermont licensed lead abatement firm, pursuant to the Vermont Regulations for Lead Control.

- Subsequent to renovation/demolition activities a lead-specific final cleaning should be conducted in all areas and lead in dust sampling should be completed prior to building occupancy.

2.4 LEAD IN DUST SAMPLING

As required by the SSQAPP, lead-in-dust sampling was conducted pursuant to the Cardno ATC SOP F-SOP-1.20.

Cardno ATC collected lead in dust samples from representative locations throughout the facility on December 17, 2012. Lead in dust sampling was conducted to determine existing lead-in-dust levels and to determine potential impacts related to the reported use of the basement as an indoor firing range. On December 10, 2012, Cardno ATC interviewed St. Johnsbury Police Chief Clement Houde and Corporal Gil Roberts regarding the possible former use of the armory building and the location of the former firing range. According to Cpl. Roberts, the building has not included an indoor firing range since at the latest 1992. Upon review of the space, it was determined that the range was likely located in the basement in the vicinity of rooms 26, 27, and 28. Based on this finding, lead in dust samples numbers 13-20 were collected within rooms 26 – 28 (as well as other areas of the building).

Although lead in dust samples are not a regulatory requirement prior to renovation activities, the "clearance levels" contained in the Vermont Regulations for Lead Control (V.S.A. Title 18, Chapter 38) were utilized as de facto target levels for this project. The Vermont clearance levels are 40 µg/ft² for floor samples and 250 µg/ft² for interior window sills.

For lead-abatement projects in Vermont, work areas must be cleaned until clearance dust samples indicate levels of lead-in dust are below the clearance levels. The clearance levels are commonly utilized outside of lead-abatement projects as standards to determine if a response action is needed related to lead in dust contamination. All lead in dust samples were analyzed by EMSL Analytical, Inc. of Cinnaminson NJ by Analytical Method SW846-6010B/C ICP-AES. The following **Table 2** summarizes lead in dust sampling results

Table 2 : Pre Renovation Lead in Dust Sample Results

Sample Number	*Room # / Location*	*Floor*	*Lead Concentration (µg/ft²)*	*VT Clearance Level (µg/ft²)*
F-01	03-Floor	2nd	52	40
S-02	03 – Sill	2nd	86,000	250
F-03	08 – Floor	2nd	250	40

F-19	28 - Floor	Basement	83	40
F-20	27 - Floor	Basement	260	40
F-21	29 - Floor	Basement	670	40
F-22	32 - Floor	Basement	590	40
F-23	21 - Floor	Basement	510	40
F-24	23 - Floor	Basement	2,600	40
F-25	Field Blank	NA	BDL	Not Applicable
F-26	Blind Spike*	NA	180 µg	Not Applicable

** - Spike Known Value of 232.6 µg*

As noted in **Table 2**, lead-in-dust results above target/clearance levels were identified in all levels of the building. Sample results above the target levels are shaded in **Table 2**; rooms where the former firing range was apparently located have also been highlighted (in yellow) in **Table 2.**

2.4.1 Lead in Dust Quality Assurance/Quality Control

Pursuant to QA/QC procedures within the SSQAPP Cardno ATC submitted one "blind" lead-in-dust spike sample (sample # F-26) with a known lead content of 232.6 µg. Pursuant to the SSQAPP the acceptance criteria is within +/- 30% of the known lead content (162.82 – 302.38 µg). The analysis result of the spike sample was 180 µg and therefore falls within the acceptance criteria. In addition, no lead was detected in the field blank (sample # F-25).

Appendix D contains the lead in dust sample location diagram (which includes the approximate location of the former firing range) and the lead in dust laboratory hardcopy results.

2.4.2 Lead in Dust Recommendations

- Copies of this report should be provided to the general contractor and demolition contractor to assist with compliance to VOSHA Lead in Construction Standard.
- Subsequent to renovation/demolition activities a lead-specific final cleaning should be conducted in all areas and lead in dust sampling should be completed prior to building occupancy.

2.5 Indoor Air Quality Investigation

Pursuant to the SSQAPP, Cardno ATC conducted air sampling for culturable fungi and total fungal structures in four (4) indoor locations and one (1) outdoor location for comparison. *The mold assessment was conducted pursuant to the Cardno ATC "Guidelines for Environmental Sampling for Microbial Contamination" (April 2002) hereby incorporated into the Cardno ATC Generic QAPP as Cardno ATC SOP F-SOP-1.21.*

Cardno ATC utilized an Andersen N6 sampler to collect the airborne culturable mold samples on malt extract agar plates for 5 minutes at a flow rate of approximately 27.29 liters per minute. Zefon Air-O-Cell™ microbial spore trap cassettes and a Buck Bio-Aire sampling pump (serial number B150547) were used to collect each sample of total airborne fungal structures for 10 minutes at a flow rate of 15 liters per minute. Both bioaerosol sampling techniques were calibrated prior to sample collection. Bulk (swab) samples were also collected in areas of apparent mold growth.

The air and bulk samples were submitted to EMSL Analytical Inc. of Cinnaminson NJ for analysis of predominant mold species and concentrations.

The American Conference of Governmental Industrial Hygienists (ACGIH) considers comparison of indoor/outdoor bioaerosol data a common method for evaluating indoor fungal reservoirs or concerns. In well maintained indoor environments, the total concentrations of fungi in the indoor air are commonly equal to, or less than, the total concentration outdoors. If indoor fungal bioaerosol concentrations are greater than those outdoors, then indoor fungal reservoirs are likely to be present (however winter conditions will generally result in lower outdoor levels). In addition, the types (i.e., taxa or groups) of fungal bioaerosols found inside a building should be qualitatively similar to the taxa recovered outdoors; presuming outdoor air is the only source of indoor fungal bioaerosols. There are no regulatory standards or other widely accepted numerical guidelines available for interpretation of bioaerosol data. Current ACGIH guidelines refrain from providing numerical thresholds for bioaerosols.

The following **Table 3** presents the total quantitative results for the culturable air samples:

Table 3: Culturable Sample Analysis			
Sample Number	***Location***	***Predominant Species***	***Total CFU/m^3***
IP-01	Exterior – North Door	*Penicillium*	98
IP-02	Room 3 – 2nd Floor	*Aspergillus*	210
IP-03	Room 11 – 1st Floor	*Aspergillus*	511
IP-04	Room 25 - Basement	*Aspergillus*	252
IP-05	Field Blank	*None Detected*	-

Predominant culturable species found indoors (Aspergillus) were different than the predominant species noted outdoors (Penicillium). The outdoor total was lower than indoor concentrations. Based on Cardno ATC's experience the indoor levels are not considered significantly elevated and due to ambient temperatures being at or below freezing (which would serve to reduce the total cultural spore concentrations and types found outside) it is not unusual for indoor levels to exceed outdoor levels under these conditions. The predominant types of fungi identified (inside and outside) are common types of fungi. Based on Cardno ATC's experience the culturable levels identified do not represent a significant concern.

The following **Table 4** presents the quantitative results for the total airborne fungal structure samples:

Table 4: Total Airborne Fungal Structure Sample Analysis

Sample Number	***Location***	***Predominant Species***	***Total Structures/m^3***
Z-01	Exterior – North Door	*Aspergillus/Penicillium*	611
Z-02	Room 3 – 2nd Floor	*Aspergillus/Penicillium*	577
Z-03	Room 11 – 1st Floor	*Aspergillus/Penicillium*	458
Z-04	Room 25 - Basement	*Aspergillus/Penicillium*	3,187
Z-05	Field Blank	*None Detected*	-

The predominant spore types found outdoors were similar to the indoor predominant types (Aspergillus/Penicillium) and except for the basement sample the totals were similar as well. The basement (room 25) level however, did indicate a possible amplification of Aspergillus/Penicillium fungal types.

The following **Table 5** presents the total qualitative results for the swab samples:

Table 5: Fungal Structure Swab Sample Analysis

Sample Number	***Location***	***Substrate***	***Area (ft^2)***	***Predominant Species***	***Category Count***
S-01	Room 16/11 – wall Bottom of Stairs	*Plaster*	*<1*	*Chaetomium*	High
				Penicillum	Medium
				Aspergillus	Rare
S-02	Room 03 – West Wall	*Plaster*	*<1*	*Penicillium/Aspergillus*	Rare
				Cladosporium	Rare
S-03	Room 16 – Ceiling	*Structural Wood*	*25*	*None Detected*	-
S-04	Field Blank	*Not Applicable*	*Not Applicable*	*None Detected*	-

As noted in Table 5 above, only limited areas of apparent visual fungal growth were noted by Cardno ATC Swab samples (samples S-01, S-02 and S-03) were collected from areas of apparent growth. Analysis of swab samples for fungal spores and structures indicated the presence of common fungal structures on only two of the three swab samples. Extensive fungal growth was not observed by Cardno ATC within the building. **Appendix E** includes the fungi sample location diagram and laboratory hardcopy results of the fungi sampling.

2.5.1 IAQ Quality Assurance/Quality Control

Indoor air quality sampling was conducted pursuant to Cardno ATC's "Guidelines for Environmental Sampling for Microbial Contamination". One field blank sample was collected for each type of fungal analysis. No contamination was noted on any of the field blank samples.

2.5.2 IAQ Recommendations

- If significant fungal growth is identified during renovation/demolition activities, removal of the growth should be conducted pursuant to the EPA document Mold Remediation in Schools and Commercial Buildings (EPA 402-K-01-001).
- Subsequent to renovation/demolition activities a final HEPA cleaning should be conducted in the basement area.
- Any sources of water infiltration should be corrected. Continued water infiltration (such as roof leaks) would likely cause additional IAQ related problems. If renovations are not planned for the near-future, additional mold sampling may be warranted.

2.6 SEDIMENT SAMPLING AND DYE TEST

Cardno ATC conducted an investigation related to the presence of the floor drain system in the basement, to help determine potential impacts to the subsurface related to potential vehicle maintenance previously conducted in the basement level. The investigation included a visual inspection of the drain system, interviewing individuals with knowledge of the building's historical use, sampling of sediment in the floor drain itself, as well as performing a dye tracing test to determine the discharge location of the drain system.

The floor drain system in the basement consists of and exterior catch basin adjacent to the southwest entrance, an abandoned trench drain in the southwest corner, a floor drain to the north of the trench drain, a sump pump adjacent to the floor drain and a clean-out pit in the northeast corner of the basement. All the basement catch basins and sump/pump appear to discharge tot the main wastewater line for the building which runs along the north wall and to the cleanout-pit (see dye-test results below). **Appendix F** contains a diagram of the configuration of the floor drain system.

On December 10, 2012, Cardno ATC interviewed St. Johnsbury Police Corporal Gil Roberts regarding the drainage configuration in the vicinity of room 28. Cpl. Roberts described the Police Department's historical use of the room (vehicle maintenance, cleaning, and storage) as well as drainage patterns during use.

The visual examination and Cpl. Roberts' description both indicated that wastewater entering the floor drain in room 28 flows north into the sump at the north end of room 28. A sump pump lifts that water into the building main wastewater line in room 29. From room 29, the main wastewater line runs east along the north wall of the basement, until it reaches a cleanout/trap in a pit in the northeast corner of room 21. From there it continues generally east to the city sewer under Main St.

On December 17, 2012, sediment samples from the floor drain in room 28 were collected to be analyzed for the following analytes: diesel range organics (S-01) via EPA SW-846 Method 8015B – DRO., mercury (S-03) via EPA SW-846 Method 7471B, metals (S-05) via EPA SW-846 Method 6010 C and volatile organic compounds (S-07) via EPA SW-846 Method 8260B. Duplicate samples were collected of each (S-02, S-04, S-06, and S-08, respectively). All sediment samples were collected pursuant to Cardno ATC's standard operating procedure F-SOP-1.7. The results of the sediment sampling were compared to the Soil Screening Values (SSVs) for industrial and commercial properties as listed in the Vermont Department of Environmental Conservation's "Investigation and Remediation of Contaminated Properties

Procedures". **Sediment concentrations of arsenic and bromomethane exceeded the SSVs.** It should be noted that concentrations of four analytes were identified in S-08 (duplicate) that were not identified in S-07. None of these additional detections exceeded the relevant SSV. A summary of sediment sample detections (from the initial sediment samples) are provided in the following **Table 6**:

Table 6: Sediment Sample Detections

Sample Number	*Analyte*	*Result*	*SSV*	*Unit*
S-01	DRO*	120	1,000	mg/kg
S-03	Mercury	0.063	43	mg/kg
S-05	Antimony	0.54	410	mg/kg
S-05	Arsenic	2.5	1.6	mg/kg
S-05	Beryllium	0.38	2,000	mg/kg
S-05	Cadmium	0.45	800	mg/kg
S-05	Chromium	19.3	103	mg/kg
S-05	Copper	56.4	41,000	mg/kg
S-05	Lead	62.1	800	mg/kg
S-05	Nickel**	20.1	20,000	mg/kg
S-05	Zinc	101	310,000	mg/kg
S-07	Bromomethane	37	32	µg/kg
S-07	Acetone	310	630,000	µg/kg
S-07	Methyl acetate	120	1,000,000	µg/kg

* - Diesel Range Organics, compared to the SSV for Total Petroleum Hydrocarbons

On December 18, 2013, a dye test was performed to confirm the discharge point of the building wastewater system. Hugh Wescott of the St. Johnsbury Department of Public Works (DPW) visited the site. Mr. Wescott indicated that he has no knowledge of any wastewater discharge from the armory building other than the main wastewater line to the city sewer. DPW provided access to a sewer junction (manhole) downstream of the armory. Dyed water was released into the cleanout in the northeast corner of room 21. Approximately six minutes later, dye was observed flowing through the downstream manhole, located east of the site in a parking lot off of Route 2 (this downstream manhole location is depicted on the Site Diagram).

The results of this investigation indicate the likelihood that any pollutant captured by the floor drain system in room 28 would have been discharged to the city wastewater system and it would be unlikely that a significant impact to the subsurface has occurred on site.

2.6.1 Sediment Sampling Quality Assurance/Quality Control

The sediment sampling was conducted pursuant to the Cardno ATC "Standard Procedure, Sediment Sampling" hereby incorporated into the Cardno ATC Generic QAPP as Cardno ATC SOP F-SOP-1.7. Of analytes that were detected in the sediment samples, only acetone (a common laboratory contaminant) was found in excess of the relative percent difference requirements established in the QAPP. It should be noted that, due to laboratory equipment malfunctions, analysis of the VOC duplicate samples was completed outside of the holding time. However, due to the relative consistency between the initial and duplicate samples Cardno ATC considers the data to be valid.

2.6.2 Sediment Sampling and Dye Test Recommendations

Results of the investigation indicate elevated levels of some pollutants in the floor drain sediment. Any sediment (likely less than on 55-gallon drum) associated with the floor drain system should be excavated and disposed of according to all applicable state and federal regulations.

Signatures of Environmental Professionals

Cardno ATC has performed above activities in general conformance with the project QAPP (Addenda F-1) for the Former St. Johnsbury Armory located in St. Johnsbury, VT.

H10	2x4 Ceiling tile – Worms and Pinholes	ND	Previously Sampled	NA
H11	**Plaster Walls and Ceilings**	**2%**	**Previously Sampled**	**NQ Throughout facility**
H12	Carpet Mastic	ND*	12A-12C	NA

ND = Non Detected by Polarized Light Microscopy (PLM)
NA= Not Applicable NQ = Not Quantified

* - PLM is not consistently reliable for detecting asbestos in non-friable organically bound (NOB) materials (e.g. floor tiles, roofing, mastics). Therefore if PLM analysis has concluded that asbestos was not detected in a non-friable organically bound material, Quantitative TEM with NOB prep is the recommended analytical method that should be used to confirm that a material is negative.

Trace: Materials containing "trace" amounts of asbestos (<1%) are not considered Asbestos Containing Materials (ACM) by the US EPA and many state agencies. However, certain sections of OSHA standard 29 CFR 1926.1101 apply when such materials are subject to demolition. Refer to "OSHA Standard Interpretation and Compliance Letter" dated 8/13/1999, subject: "Requirements for demolition operations involving material containing <1% asbestos".

NOTES:

1) The Limit of Detection is the same as the Reporting Limit for these results.

2) The Reporting Limit (RL) is the Limit of Quantitation. For point counts the limit of quantitation of 0.25%; based on one asbestos point counter over 400 non-empty points.

3) Asbestos Containing Material (ACM) Definition: > 1% asbestos by weight is considered an ACM

4) Disclaimer: The laboratory is not responsible for sample collection. Please refer to enclosed letter. This report may not be reproduced, except in full, without written approval by ATC Associates Inc. This report may not be used to claim product endorsement by NVLAP or any other agency of the U.S. Government. This report relates only to the samples reported above as described in the chain of custody. Quality control data is available upon request.

5) Accredited by NVLAP #101187-0 and by NY State ELAP #10679

6) Confidentiality Notice: The document(s) contained herein are confidential and privileged information, intended for the exclusive use of the individual or entity named above.

7) Liability Notice: ATC Associates Inc. and its personnel shall not be liable for any misinformation provided to us by the client regarding these samples. This report relates only to samples submitted and analyzed.

8) When the results display more than three digits, only the first three are significant. The data within this report is reliable to 3 significant figures.

9) The condition of all samples was acceptable upon receipt.

10) The laboratory certifies that the test results meet all requirements of NELAC.

11) Supplement to test report batch # _____. Amendments: ____. Amendment Dates: _____. Amended by: _____

12) PLM Letter is attached on this report.

13) TRACE: The result is reported as Trace when No points are counted and asbestos is identified. For ELAP Trace is < 1%.

14) ATC certifies that this report is an accurate and authentic report of the results obtained from the laboratory analysis

15) The uncertainty for these test results is available upon request.

16) Assume ACM if Vermiculite is ≥ 10%. Not Reported Vermiculite means Not Detected

Amr Fata

Laboratory Director:

BULK ASBESTOS ANALYSIS RESULTS

PLM Analysis Methodology

The samples were analyzed by industry accepted methods in accordance with EPA and ELAP methods using Polarized Light Microscopy (PLM) with dispersion staining in conjunction with stereoscopical analysis. Point counts are performed on samples regulated by these agencies. The Environmental Laboratory Approval Program (ELAP) has determined that analysis of non-friable organically bound materials (i.e. floor tile, roofing, etc.) and ceiling tiles with cellulose is not reliable when performed by Polarized Light Microscopy (PLM) method. Therefore, if this analysis included that of non-friable materials or ceiling tiles with cellulose under PLM and the results were negative, ATC must add this disclaimer to maintain our ELAP accreditation:

" Polarized light microscopy is not consistently reliable in detecting asbestos in floor coverings and similar non-friable organically bound materials. Quantitative Transmission Electron Microscopy is currently the only method that can be used to determine if this material can be considered or treated as non-asbestos containing" .

Non-friable samples that contained *Trace* or *No* PLM detectable asbestos are classified as Inconclusive. Samples that are layered and analyzed by the gravimetric method as composites (NESHAP, AHERA) should be considered positive if results are between trace and 1%, unless every layer is analyzed separately.

ELAP requires that materials containing vermiculite at 10% or more must be reported as ACM.

EPA does not regulate mixed mineral assemblage like the anthophyllite-talc intergrowth that is found in paint and caulking unless these materials contain asbestos in an amount greater than 1%. Anthophyllite detected in paint and caulking samples might be a talc intergrowth.

ATC has the capability of performing TEM confirmation if so desired.

All bulk sample reports are checked and reviewed two times. Unused portions of samples are archived for three months unless client requests special handling. This report must not be used by the client to claim product endorsement by NIST or any agency of the U.S. government.

ATC Associates Inc. is not responsible for sample collection and analytical procedures not performed by our laboratory. This report may not be reproduced in part without the laboratory permission.

ATC Associates will not be liable for analytical results from samples that are not prepared according to the standard methods (EPA, ELAP, etc.) used by the laboratory (e.g. composite samples from different locations, samples with insufficient volumes, straight TEM samples without gravimetric procedures, dust samples, non-friable samples by PLM only).

Laboratory Equipment

Laboratory analysis was accomplished utilizing Olympus BH-2 Microscopes.

Quality Control

ATC Associates Inc. is accredited by NVLAP (Lab Code 101187-0) and NY State DOH ELAP (Lab ID 10879) for bulk and air fiber analyses. ATC participates in the Bulk Asbestos Sample Quality Assurance Programs for NVLAP and ELAP and maintains an in-house QC/QA program for bulk samples whereby 10% of all submitted samples are reanalyzed and documented in a Quality Control Manual. ATC also participates in a quarterly round robin QC/QA program for bulk samples with several accredited laboratories throughout the United States. Current and past QC/QA program results are available in the laboratory for inspection.

Accuracy and Precision

The phase abundances provided by point count may be considered within the limits of variability inherent in the method employed. For point counts the detection limit of 0.25% is based on one asbestos point counted over 400 non-empty points. If no points are counted and asbestos is identified, the result will be reported as trace. For ELAP trace is < 1%.

The analyses were supervised by Milena Bonezzi, Director of Laboratory Services, who has extensive experience in asbestos analysis by PLM and other methods. Please contact me regarding any questions relating to these materials at 212-353-8280 Ext. 247.

1. EPA Methods: 600/M4-82-020 and 600/R-93/116
2. ELAP Method: 4088 Items 198.1 and 198.4 and 198.6

Sincerely,

Milena Bonezzi

12/31/2012

The following analytical report covers the analysis performed on samples submitted to EMSL Analytical, Inc. on 12/27/2012. The results are tabulated on the attached data pages for the following client designated project:

63.35078.0013

The reference number for these samples is EMSL Order #011205781. Please use this reference when calling about these samples. If you have any questions, please do not hesitate to contact me at (856) 303-2500.

Reviewed and Approved By:

Julie Smith - Laboratory Director

The test results contained within this report meet the requirements of NELAC and/or the specific certification program that is applicable, unless otherwise noted.
NELAP Certifications: NJ 03036, NY 10896, PA 68-00367

The samples associated with this report were received in good condition unless otherwise noted. This report relates only to those items tested as received by the laboratory. The QC data associated with the sample results meet the recovery and precision requirements established by the NELAP, unless specifically indicated. All results for soil samples are reported on a dry weight basis, unless otherwise noted. This report may not be reproduced except in full and without written approval by EMSL Analytical, Inc.

Analysis Requested

Preservation Codes:
A - HCL, B - NaOH, C - Zn Acetate, D - Nitric Acid, E - NaHSO4, F - MeOH, G - Amchlor, H - Ascorbic Acid, I - Ice, J - DI Water, K - EDTA, L - EDA, M - Hexane, N - None, O - AsNaO2, P - Na2O4S, Q - Na2SO3, R - Na2S2SO3, S - H2SO4, T - TSP Dodecahydrate, U - Acetone, V - MCAA, W - ph 4-5, Z - other (specify)
Other:

	Sample Identification - Client ID	Sample Date	Sample Time	Sample Type (C=comp, G=grab)	Matrix (W=water, S=solid, O=waste/oil, BT=Tissue, A=Air)	Field Filtered Sample (Yes or No)	Perform MS/MSD (Yes or No)	SW846 - 8082 WITH (3540 PREP)	Total Number of containers	Sample #'s / Special Instructions/Note:
			Preservation Code:							
1	H1 - Door Caulking Grey	12/17	~~1005~~	G	S			X		1A
2	" "		1006							1B
3	H2 - Window Caulk White		~~1015~~							2A
4	" "		1020							2B
5	H3 - Window Glaze		1022							3A
6	" "		1026							3B
7	H4 - Window Caulk		1031							4A
8	" "		1035							4B
9	H5 - Tar Caulking		1040							5A
10	" "		1042							5B
11	H6 - Silver Flashing		1101							6A

per Steve - 21 separate samples, Do Not Composite
12/27 11:10AM - TA

Possible Hazard Identification
☐ Non-Hazard ☐ Flammable ☐ Skin Irritant ☐ Poison B ☐ Unknown ☐ Radiological

Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)
☐ Return To Client ☐ Disposal By Lab ☐ Archive For ____ Months

Deliverable Requested: I, II, III, IV, Other (specify)

Special Instructions/QC Requirements:

Relinquished by:	Date/Time: 12/19/12	Company: Cardno	Received by:	Date/Time: 12/19/12 1530	Company: TAB

XRF Protocol

XRF Protocol

LBP testing was performed at the above referenced site. The testing was performed in general conformance to the United States Department of Housing and Urban Development's (HUD) 1997 Revised Chapter 7 of the Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing (HUD guidelines), dated June, 1995. HUD guidelines define the term lead based paint as paint or other surface coatings that contain lead equal to or greater than 1.0 mg/cm^2 (by XRF) or 0.5 % by weight (laboratory paint chip analysis).

ATC conducted a LBP survey of accessible interior and exterior surfaces of the main residence. Please refer to to the attached Sample Location Diagrams for a diagram of the building complete with room numbers. For a description of the XRF instrument and procedure, see **Appendix B**: "XRF Protocol". **Appendix C** contains appropriate Lead Certifications.

Areas selected for testing were designated as "room equivalents." Pursuant to the HUD Guidelines, a room equivalent is an identifiable part of a residence, such as a room, a house exterior side or an exterior area. Within each room equivalent, "testing combinations" were identified and tested. A testing combination is characterized by a unique combination of room equivalent, building component types, and substrate (for example: all like painted doors with wood substrate within the same room). Pursuant to the 1997 Revision of Chapter 7 HUD Guidelines, one reading was completed for each testing combination except for walls, where one reading was taken for each wall in the room. Testing combinations were tested by using a LPA-1, serial # 1355, X-Ray Fluorescence Analyzer (XRF).

XRF field screening results are noted on the field sheets included within this report under **Appendix A.** Column one of the field sheets contains the type of component tested, the second column contains the condition of the painted surface, either "G" (good), "F" (fair) or "P" (poor). The third column contains the type of substrate of the component (such as wood, sheet rock, etc.). The fourth column contains the color of the painted surface at the time of the testing. Column five contains the side of the room for which the component was tested, indicated as side A, B, C, or D. As depicted on the Diagram(s) included with this report, side A is the side of the room facing the street, and moving in a clockwise direction each additional side perpendicular to the previous side (i.e. angled walls are not assigned a letter) is given the next consecutive letter. Column six contains the XRF result for that reading, column seven contains the XRF result for that reading if the testing was repeated. Column eight includes other *like components* within the room. *Like components* are similar components in the same room equivalent that should be considered to have identical paint content. If a paint chip sample is collected (due to an inconclusive XRF result or odd shaped component) then column nine contains the paint chip sample number and column ten indicates the corresponding laboratory result.

The abbreviation "LBP" will be entered in column eleven for any component and like components that are identified as lead-based paint.

The bottom of each field sheet also contains an area for remarks provided by the inspector which detail specific conditions noted for that particular area tested.

The LPA-1 Lead Paint Analyzer is a complete lead paint analysis system which quickly, accurately, and non-destructively measures the concentration of LBP on surfaces. The LPA-1 relies on the measurement of the K-shell X-rays to determine the amount of lead present in the painted surface. K-shell X-rays can penetrate many layers of paint and allow a good measurement of the lead content of paint to be made without being significantly affected by the thickness or number of layers of paint on the surface of the sample.

The LPA-1 has the ability to analyze and compute corrections for the differences in the energy spectrums relating to different substrates. This analysis of the energy spectrum means that the lead paint reading

displayed on the instrument already accounts for any substrate effects and no correction is required by the operator. The LPA-1's field of view is limited to a depth of 3/8", deep enough to handle virtually all painted surfaces, but not prone to detect lead objects located behind the surface.

There are two measurement modes of operation in the LPA-1 analyzer namely the "Standard Mode" and the "Quick Mode". In the "Standard" mode, the operator selects a fixed measurement time which remains constant irrespective of the lead signal. In the "Quick" mode, the analyzer automatically adjusts the measurement time to be the least time that is needed to make a definitive measurement with a 95% confidence level (2 sigma). The LPA-1 analyzer will finish a measurement once the 2 sigma confidence level is achieved and the data is statistically meaningful. This time period for conclusive measurements is typically between 1 to 5 seconds, but can extend to a measurement of 60 seconds depending on the action level for abatement. ATC utilized the LPA-1 in the "Quick" mode for the testing performed at this unit. The highest level of LBP reported by the LPA-1 using the "Quick" mode is a result of > 9.9 mg/cm2 (greater than 9.9 mg/cm2). This result indicates LBP significantly over the HUD definition of 1.0 mg/cm2.

A "validation test" was performed to ensure that the instrument was operating properly. The validation test was performed on a calibration test block supplied by the manufacturer, as well as the National Institute for Standards and Testing (NIST) 1.02 mg/cm2 test film to determine if the instrument measured the lead content consistently on a day to day basis. A series of three standard measurements consisting of 60 seconds per measurement were taken on the test blocks. The individual readings were recorded and compared to the factory test data provided with the instrument. Please find validation test results on the enclosed field sheets.

Performance Characteristic Sheet

Performance Characteristic Sheet

EFFECTIVE DATE: **October 25, 2006** **EDITION NO.: 5**

MANUFACTURER AND MODEL:

Make: ***Radiation Monitoring Devices***
Model: ***LPA-1***
Source: ^{57}Co
Note: This sheet supersedes all previous sheets for the XRF instrument of the make, model, and source shown above ***for instruments sold or serviced after June 26, 1995. For other instruments, see prior editions.***

FIELD OPERATION GUIDANCE

OPERATING PARAMETERS:

Quick mode or 30-second equivalent standard (Time Corrected) mode readings.

XRF CALIBRATION CHECK LIMITS:

0.7 to 1.3 mg/cm^2 (inclusive)

SUBSTRATE CORRECTION:

For XRF results below 4.0 mg/cm^2, substrate correction is recommended for:

Metal using 30-second equivalent standard (Time Corrected) mode readings.
None using quick mode readings.

Substrate correction is not needed for:

Brick, Concrete, Drywall, Plaster, and Wood using 30-second equivalent standard (Time Corrected) mode readings
Brick, Concrete, Drywall, Metal, Plaster, and Wood using quick mode readings

THRESHOLDS:

30-SECOND EQUIVALENT STANDARD MODE READING DESCRIPTION	SUBSTRATE	THRESHOLD (mg/cm^2)
Results corrected for substrate bias on metal substrate only	Brick	1.0
	Concrete	1.0
	Drywall	1.0
	Metal	0.9
	Plaster	1.0
	Wood	1.0

QUICK MODE READING DESCRIPTION	SUBSTRATE	THRESHOLD (mg/cm^2)
Readings not corrected for substrate bias on any substrate	Brick	1.0
	Concrete	1.0
	Drywall	1.0
	Metal	1.0
	Plaster	1.0
	Wood	1.0

BACKGROUND INFORMATION

EVALUATION DATA SOURCE AND DATE:

This sheet is supplemental information to be used in conjunction with Chapter 7 of the HUD *Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing* ("HUD Guidelines"). Performance parameters shown on this sheet are calculated from the EPA/HUD evaluation using archived building components. Testing was conducted on approximately 150 test locations in July 1995. The instrument that performed testing in September had a new source installed in June 1995 with 12 mCi initial strength.

OPERATING PARAMETERS:

Performance parameters shown in this sheet are applicable only when properly operating the instrument using the manufacturer's instructions and procedures described in Chapter 7 of the HUD Guidelines.

XRF CALIBRATION CHECK:

The calibration of the XRF instrument should be checked using the paint film nearest 1.0 mg/cm^2 in the NIST Standard Reference Material (SRM) used (e.g., for NIST SRM 2579, use the 1.02 mg/cm^2 film).

If readings are outside the acceptable calibration check range, follow the manufacturer's instructions to bring the instruments into control before XRF testing proceeds.

SUBSTRATE CORRECTION VALUE COMPUTATION:

Chapter 7 of the HUD Guidelines provides guidance on correcting XRF results for substrate bias. Supplemental guidance for using the paint film nearest 1.0 mg/cm^2 for substrate correction is provided:

XRF results are corrected for substrate bias by subtracting from each XRF result a correction value determined separately in each house for single-family housing or in each development for multifamily housing, for each substrate. The correction value is an average of XRF readings taken over the NIST SRM paint film nearest to 1.02 mg/cm^2 at test locations that have been scraped bare of their paint covering. Compute the correction values as follows:

> Using the same XRF instrument, take three readings on a bare substrate area covered with the NIST SRM paint film nearest 1 mg/cm^2. Repeat this procedure by taking three more readings on a second bare substrate area of the same substrate covered with the NIST SRM.
>
> Compute the correction value for each substrate type where XRF readings indicate substrate correction is needed by computing the average of all six readings as shown below.
>
> For each substrate type (the 1.02 mg/cm^2 NIST SRM is shown in this example; use the actual lead loading of the NIST SRM used for substrate correction):
>
> $$\text{Correction value} = (1^{st} + 2^{nd} + 3^{rd} + 4^{th} + 5^{th} + 6^{th}\ \textit{Reading}) / 6 - 1.02\ \text{mg/cm}^2$$
>
> Repeat this procedure for each substrate requiring substrate correction in the house or housing development.

EVALUATING THE QUALITY OF XRF TESTING:

Randomly select ten testing combinations for retesting from each house or from two randomly selected units in multifamily housing. Use either the Quick Mode or 30-second equivalent standard (Time Corrected) Mode readings.

Conduct XRF re-testing at the ten testing combinations selected for retesting.

Determine if the XRF testing in the units or house passed or failed the test by applying the steps below.

Compute the Retest Tolerance Limit by the following steps:

Determine XRF results for the original and retest XRF readings. Do not correct the original or retest results for substrate bias. In single-family and multi-family housing, a result is defined as a single reading. Therefore, there will be ten original and ten retest XRF results for each house or for the two selected units.

Calculate the average of the original XRF result and retest XRF result for each testing combination.

Square the average for each testing combination.

Add the ten squared averages together. Call this quantity C.

Multiply the number C by 0.0072. Call this quantity D.

Add the number 0.032 to D. Call this quantity E.

Take the square root of E. Call this quantity F.

Multiply F by 1.645. The result is the Retest Tolerance Limit.

Compute the average of all ten original XRF results.

Compute the average of all ten re-test XRF results.

Find the absolute difference of the two averages.

If the difference is less than the Retest Tolerance Limit, the inspection has passed the retest. If the difference of the overall averages equals or exceeds the Retest Tolerance Limit, this procedure should be repeated with ten new testing combinations. If the difference of the overall averages is equal to or greater than the Retest Tolerance Limit a second time, then the inspection should be considered deficient.

Use of this procedure is estimated to produce a spurious result approximately 1% of the time. That is, results of this procedure will call for further examination when no examination is warranted in approximately 1 out of 100 dwelling units tested.

BIAS AND PRECISION:

Do not use these bias and precision data to correct for substrate bias. These bias and precision data were computed without substrate correction from samples with reported laboratory results less than 4.0 mg/cm^2 lead. The data which were used to determine the bias and precision estimates given in the table below have the following properties. During the July 1995 testing, there were 15 test locations with a laboratory-reported result equal to or greater than 4.0 mg/cm^2 lead. Of these, one 30-second standard mode reading was less than 1.0 mg/cm^2 and none of the quick mode readings were less than 1.0 mg/cm^2. The instrument that tested in July is representative of instruments sold or serviced after June 26, 1995. These data are for illustrative purposes only. Actual bias must be determined on the site. Results provided above already account for bias and precision. Bias and precision ranges are provided to show the variability found between machines of the same model.

30-SECOND STANDARD MODE READING MEASURED AT	SUBSTRATE	BIAS (mg/cm^2)	PRECISION* (mg/cm^2)
0.0 mg/cm^2	Brick	0.0	0.1
	Concrete	0.0	0.1
	Drywall	0.1	0.1
	Metal	0.3	0.1
	Plaster	0.1	0.1
	Wood	0.0	0.1
0.5 mg/cm^2	Brick	0.0	0.2
	Concrete	0.0	0.2
	Drywall	0.0	0.2
	Metal	0.2	0.2
	Plaster	0.0	0.2
	Wood	0.0	0.2
1.0 mg/cm^2	Brick	0.0	0.3
	Concrete	0.0	0.3
	Drywall	0.0	0.3
	Metal	0.2	0.3
	Plaster	0.0	0.3
	Wood	0.0	0.3
2.0 mg/cm^2	Brick	-0.1	0.4
	Concrete	-0.1	0.4
	Drywall	-0.1	0.4
	Metal	0.1	0.4
	Plaster	-0.1	0.4
	Wood	-0.1	0.4

*Precision at 1 standard deviation.

CLASSIFICATION RESULTS:

XRF results are classified as positive if they are greater than the upper boundary of the inconclusive range, and negative if they are less than the lower boundary of the inconclusive range, or inconclusive if in between. The inconclusive range includes both its upper and lower bounds. Earlier editions of this *XRF Performance Characteristics Sheet* did not include both bounds of the inconclusive range as "inconclusive." While this edition of the Performance Characteristics Sheet uses a different system, the specific XRF readings that are considered positive, negative, or inconclusive for a given XRF model and substrate remain unchanged, so previous inspection results are not affected.

DOCUMENTATION:

An EPA document titled *Methodology for XRF Performance Characteristic Sheets* provides an explanation of the statistical methodology used to construct the data in the sheets, and provides empirical results from using the recommended inconclusive ranges or thresholds for specific XRF instruments. For a copy of this document call the National Lead Information Center Clearinghouse at 1-800-424-LEAD. A HUD document titled *A Nonparametric Method for Estimating the 5th and 95th Percentile Curves of Variable-Time XRF Readings Based on Monotone Regression* provides supplemental information on the methodology for variable-time XRF instruments. A copy of this document can be obtained from the HUD lead web site, www.hud.gov/offices/lead.

This XRF Performance Characteristic Sheet was developed by QuanTech, Inc., under a contract from the U.S. Department of Housing and Urban Development (HUD). HUD has determined that the information provided here is acceptable when used as guidance in conjunction with Chapter 7, Lead-Based Paint Inspection, of HUD's *Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing.*

12/31/2012

The following analytical report covers the analysis performed on samples submitted to EMSL Analytical, Inc. on 12/21/2012. The results are tabulated on the attached data pages for the following client designated project:

63.35078.0013

The reference number for these samples is EMSL Order #011205745. Please use this reference when calling about these samples. If you have any questions, please do not hesitate to contact me at (856) 303-2500.

Reviewed and Approved By:

Julie Smith - Laboratory Director

The test results contained within this report meet the requirements of NELAC and/or the specific certification program that is applicable, unless otherwise noted.
NELAP Certifications: NJ 03036, NY 10896, PA 68-00367

The samples associated with this report were received in good condition unless otherwise noted. This report relates only to those items tested as received by the laboratory. The QC data associated with the sample results meet the recovery and precision requirements established by the NELAP, unless specifically indicated. All results for soil samples are reported on a dry weight basis, unless otherwise noted. This report may not be reproduced except in full and without written approval by EMSL Analytical, Inc.

Received (Lab):	Travis Albert	**Date:**	12/21/12	**Time:**	2:30pm

Comments:

- must called due to method being used (EMSL SOP 001 Revision 7 or Pb-FLAA?)
- Called. Eric picked up. gave me Harland Miller's number 1:54pm 12/21/12
- Called Harland Miller's number. He answered but said he will call back to give type of method. He was not sure of method. 1:57pm 12/21/12
- Harland Miller called back. He decided to get ICP-AES method, not Pb-FLAA (lead contact+dust) 2:03pm 12/21/12

Farbod Nekouei, M.S., Laboratory Manager
or Other Approved Signatory

High levels of background particulate can obscure spores and other particulates leading to underestimation. Background levels of 5 indicate an overloading of background particulates, prohibiting accurate detection and quantification. Present = Spores detected on overloaded samples. Results are not blank corrected unless otherwise noted. The detection limit is equal to one fungal spore, structure, pollen, fiber particle or insect fragment. "*" Denotes particles found at 300X. "-" Denotes not detected. Due to method stopping rules, raw counts in excess of 100 are extrapolated based on the percentage analyzed. EMSL maintains liability limited to cost of analysis. This report relates only to the samples reported above and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. Interpretation and use of test results are the responsibility of the client. Samples received in good condition unless otherwise noted.

Sara S Goff
Project Manager I
sara.goff@testamericainc.com
02/05/2013
Revision: 1

The test results in this report relate only to sample(s) as received by the laboratory. These test results were derived under a quality system that adheres to the requirements of NELAC. Pursuant to NELAC, this report may not be produced in full without written approval from the laboratory

CASE NARRATIVE

Client: Cardno ATC

Project: St. J Armory

Report Number: 200-14287-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT
The samples were received on 12/19/2012; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 5.0 C.

Client has revised Chain-of-Custody with sample identifiers that match what is recorded on the container labels.

VOLATILE ORGANIC COMPOUNDS (GC-MS)
Samples S-07 and S-08 were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were prepared on 12/20/2012 and analyzed on 01/03/2013, 12/28/2012 and 12/31/2012.

Sample S-08 required a dilution which was performed outside of the analytical holding time. The original undiluted analysis which was performd within analytical hodling time has also been provided.

Due to poor aquisition of both low level sample aliquots the medium level aliquot was analyzed and reported.

Several analytes were detected in method blank MB 200-50187/5 at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

No other difficulties were encountered during the volatiles analyses. All other quality control parameters were within the acceptance limits.

DIESEL RANGE ORGANICS
Samples S-01 and S-02 were analyzed for diesel range organics in accordance with EPA SW-846 Method 8015B - DRO. The samples were prepared on 12/31/2012 and analyzed on 01/04/2013.

Samples S-01[3X] and S-02[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No difficulties were encountered during the DRO analyses. All quality control parameters were within the acceptance limits.

METALS (ICP)
Samples S-05 and S-06 were analyzed for Metals (ICP) in accordance with EPA SW-846 Method 6010C. The samples were prepared on 12/28/2012 and analyzed on 12/29/2012.

The serial dilution performed for sample S-05 was outside control limits for Chromium, Copper, Nickle, and Zinc. The post digestion spike percent recovery for sample S-05 was outside of control limits for Beryllium, Cadmium, Chromium, Copper, Nickle, Selenium, and Zinc.

No difficulties were encountered during the metals analyses. All quality control parameters were within the acceptance limits.

MERCURY
Samples S-03 and S-04 were analyzed for mercury in accordance with EPA SW-846 Method 7471B. The samples were prepared on 12/26/2012 and analyzed on 12/28/2012.

Hg was detected in method blank MB 200-50058/11-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

No other difficulties were encountered during the mercury analyses. All other quality control parameters were within the acceptance limits.

DATA REPORTING QUALIFIERS

Client: Cardno ATC

Job Number: 200-14287-1

Lab Section	Qualifier	Description
GC/MS VOA		
	B	Compound was found in the blank and sample.
	U	Indicates the analyte was analyzed for but not detected.
	E	Result exceeded calibration range.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	H	Sample was prepped or analyzed beyond the specified holding time
GC Semi VOA		
	U	Indicates the analyte was analyzed for but not detected.
Metals		
	B	Compound was found in the blank and sample.
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

APPENDIX B

Appendix B
Hazardous Building Material Inspection
Former St. Johnsbury Armory
St. Johnsbury, VT

Date: 2/3/21	**Location:** Gym
Description: PCBs black flooring paper under hardwood	

Date: 2/3/21	**Location:** 2nd Floor
Description: PCBs Light Pink Paint 2nd Floor	

Appendix B
Hazardous Building Material Inspection
Former St. Johnsbury Armory
St. Johnsbury, VT

Date: 2/3/21	**Location:** 1st Floor
Description: PCBs tan subfloor paper under hardwood	

Date: 2/3/21	**Location:** 2nd Floor
Description: PCBs blue wall paint	

Appendix B
Hazardous Building Material Inspection
Former St. Johnsbury Armory
St. Johnsbury, VT

Date: 2/3/21	**Location:** 2nd floor NE room
Description: Non-ACM Ceiling Tile	

Date: 2/3/21	**Location:** 2nd Floor SW Room
Description: Non-ACM Black Electrical Wiring	

Appendix B
Hazardous Building Material Inspection
Former St. Johnsbury Armory
St. Johnsbury, VT

Date: 2/3/21	**Location:** 2nd Floor
Description: Non-ACM Knob and Tube Wiring and Black Electrical Wiring	

Date: 2/3/21	**Location:** 1st Floor
Description: Non-ACM Brown Battleship Linoleum

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

Samples analyzed by EMSL Analytical, Inc. Woburn, MA NVLAP Lab Code 101147-0, CT PH-0315, MA AA000188, RI AAL-139, VT AL998919, ME LB-0039

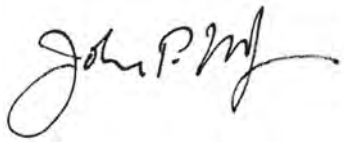
Re: Lead Based Paint Assessment
Former St. Johnsbury Armory, 1249 Main Street, St. Johnsbury, Vermont
K-D Project No.: 21038-001

Dear Mr. Stewart,

At your request a representative of K-D Associates, Inc. visited the former St. Johnsbury Armory at 1249 Main Street in St. Johnsbury, Vermont to conduct an inspection for the presence of lead-based paint (LBP) on interior and exterior surfaces. The survey evaluated painted surfaces for the presence, quantity, locations, and character of LBP. All work was conducted by a State of Vermont certified Lead Inspector.

Surfaces in the Armory were classified by building component and substrate. Testing was specific and in sufficient detail to determine if individual surfaces do or do not contain LBP. All paint sampling was done by XRF testing. No results in the inconclusive range were recorded and no paint chip sampling or laboratory analysis was needed. The survey was conducted using a Niton XLp 300 model (Serial No. 7709) in the Lead-In-Paint K & L variable time reading mode. According to the instruments *Performance Characteristic Sheet*, the inconclusive range for this model is 0.8 to 1.2 mg/cm^2. Substrate correction is also not needed for this model on brick, concrete, drywall, plaster and wood. The objective of the testing was to find LBP surfaces with the concentration of lead above 1.0 mg/cm^2 by XRF analysis.

The results of this inspection indicate that lead in amounts greater than or equal to 1.0 mg/cm^2 in paint (i.e Lead Based Paint) was found on the following surfaces:



Component	Location	Color	Lead Content (mg/cm^2)
Walls, plaster, B and D	Room 6, Second Level	Tan	1.3 to 1.5
Stair railing, wood	First to second level	Brown	1.9
Wall, brick, A, B, D	Room 20, Basement	Tan	3.0 to 4.0
Ceiling, metal	Room 21, Basement	White	1.6
Walls, brick, A, B, C, D	Room 21, Basement	Green	1.2 to 1.6
Floor, cement	Room 22, Basement	Green	1.5
Walls, brick, A, B, C, D	Room 23, Basement	Green	2.7 to 3.1
Floor, cement	Room 23, Basement	Grey	1.3
Stair riser	Basement to first level	White	1.1
Window trim, A, B, C, D	Exterior	White	12.2 to19.3
Window sash, A, B, C, D	Exterior	Green	19.9 to 28.6
Window well, A, B, C, D	Exterior or interior with storm	White	12.6 to 19.0
Porch trim, D	Exterior	White	1.7
Column, wood	Room 6	Brown	1.9

41 IDX Drive • Suite 209 • South Burlington • Vermont • 05403-7757
(802) 862-7490 • (800) 639-2035 • Fax (802) 660-2462
e-mail: kdai@kdassociatesinc.com • website: www.kdassociatesinc.com

Field sheets showing individual measurements for components are attached. Floor plan sketches are also included with room numbers referenced on the field sheets and results table. The letter (A, B, C, D) designation for the building (and room) refers to the side of the building where the component is located.

Please do not hesitate to call if you have any questions or need additional information.

Sincerely,

John P. Madigan

Calibration Check Test Results

Address/ Unit No.: St. Johnsbury Armory, 1249 Main Street, St. Johnsbury, Vermont

Device: Niton XLP 300 XRF Serial No.: SN# 7709

Contractor: K-D Associates, Inc. Date: 3 February 2021

Inspector: John P. Madigan Signature: John P. Madigan

NIST SRM Used 1.04 *mg/cm²* Calibration Check Tolerance Used: + - 0.2 *mg/cm²*

First Calibration Check:

NIST SRM			First Average	Difference Between Second Average and MIST SRM*
First Reading	Second Reading	Third Reading		
1.00	1.00	1.00	1.00	0.04

Second Calibration Check:

NIST SRM			First Average	Difference Between Second Average and MIST SRM*
First Reading	Second Reading	Third Reading		
1.01	1.01	1.00	1.01	0.03

Third Calibration Check:

NIST SRM			First Average	Difference Between Second Average and MIST SRM*
First Reading	Second Reading	Third Reading		

Fourth Calibration Check:

NIST SRM			First Average	Difference Between Second Average and MIST SRM*
First Reading	Second Reading	Third Reading		

*If the difference of the Calibration Check Average from the NIST SRM film value is greater than the specified Calibration Check Tolerance for this device, consult the manufacturer's recommendations to bring the instrument back into control. Retest all testing combination tested since the last successful Calibration Check test.

Eastern Analytical, Inc.

professional laboratory and drilling services

Tim Andrews
Nobis Group
18 Chenell Drive
Concord, NH 03301

Subject: Laboratory Report

Eastern Analytical, Inc. ID: 221858
Client Identification: St. Johnsbury Armory | 93203.11
Date Received: 2/3/2021

Report revision/reissue: Revision, replaces report dated 2/9/2021.

Revision information: Per client request, the report has been amended to include the extraction method.

Dear Mr. Andrews:

Enclosed please find the laboratory report for the above identified project. All analyses were performed in accordance with our QA/QC Program. Unless otherwise stated, holding times, preservation techniques, container types, and sample conditions adhered to EPA Protocol. Samples which were collected by Eastern Analytical, Inc. (EAI) were collected in accordance with approved EPA procedures. Eastern Analytical, Inc. certifies that the enclosed test results meet all requirements of NELAP and other applicable state certifications. Please refer to our website at www.eailabs.com for a copy of our NELAP certificate and accredited parameters.

The following standard abbreviations and conventions apply to all EAI reports:

Solid samples are reported on a dry weight basis, unless otherwise noted
< : "less than" followed by the reporting limit
> : "greater than" followed by the reporting limit
%R : % Recovery

Eastern Analytical Inc. maintains certification in the following states: Connecticut (PH-0492), Maine (NH005), Massachusetts (M-NH005), New Hampshire/NELAP (1012), Rhode Island (269) and Vermont (VT1012).

The following information is contained within this report: Sample Conditions summary, Analytical Results/Data, Quality Control data (if requested) and copies of the Chain of Custody. This report may not be reproduced except in full, without the the written approval of the laboratory.

If you have any questions regarding the results contained within, please feel free to directly contact me or the chemist(s) who performed the testing in question. Unless otherwise requested, we will dispose of the sample(s) 30 days from the sample receipt date.

We appreciate this opportunity to be of service and look forward to your continued patronage.

Sincerely,

Lorraine Olashaw — 2.17.21 — 7

221858.05	P-5	2/3/21	2/3/21	12:50	solid	98.4	Adheres to Sample Acceptance Policy

Samples were properly preserved and the pH measured when applicable unless otherwise noted. Analysis of solids for pH, Flashpoint, Ignitability, Paint Filter, Corrosivity, Conductivity and Specific Gravity are reported on an "as received" basis.
Immediate analyses, pH, Total Residual Chlorine, Dissolved Oxygen and Sulfite, performed at the laboratory were run outside of the recommended 15 minute hold time.
All results contained in this report relate only to the above listed samples.

1.0 Scope of Work

Environmental Compliance Associates, LLC (ECA) is pleased to provide NOBIS Group with the following mold inspection report to aid in identifying microbial hazards and facilitate remediation efforts at the former Armory Building located at 1249 Main Street in St. Johnsbury, Vermont. The building is a 5,600 square foot building that is planned for future renovation/occupancy.

The mold inspection was conducted by Christopher Clement, a Council-certified Microbial Consultant (CMC) and microbial laboratory analyst (#1509006).

2.0 Mold Sampling

2.1 Spore Trap Air Sampling & Methodology

The air samples were collected onto Micro5™ spore trap cassettes. The samples were collected using high flow sampling pumps. In general, air is sampled at a rate of 5 liters per minute (lpm) through the Micro5™ cassettes for 5 minutes, totaling 25 liters. Upon receipt by the laboratory, the slide is removed from the cassette for the enumeration and identification of fungal spores. The deposition trace is analyzed at 400-800X magnification using Kohler Illumination.

Spore traps provide a snapshot in time of the air quality in an indoor environment. This helps in determining how widespread mold is and to assess the health risk to building occupants, as mold typically generates allergic responses when particles and spores are inhaled.

2.2 Spore Trap Air Sample Data Interpretation

Because of the ubiquity of fungi, samples collected from suspect areas need to be evaluated against samples collected from the outdoors and non-suspect areas for comparison. In general, the genus of fungi collected from the indoor air should be like those found outdoors and should contain similar concentrations. Significantly higher concentrations of fungi of different genera can indicate a mold problem in the indoor environment.

2.3 Surface Sampling

Surface samples are typically collected in various areas throughout the building. These samples are collected by adhering a strip of clean, invisible tape directly to a surface/substrate and mounting it on a standard microscope slide for direct microscopic examination. Surface samples are helpful in determining what types of mold are present, whether growth is occurring on seemingly clean surfaces, and the extent of contamination of interior substrates.

3.0 Assessment

The mold assessment consisted of conducting a visual inspection throughout the interior and exterior of the building. Additionally, sampling was performed to collect analytical data. Neither the inspection, nor analytical results should be relied upon solely, but both are assessment tools utilized to help the inspector draw sound conclusions and make appropriate recommendations.

3.1 Site Information/Complaint History

The building is a 5,600 square foot brick structure consisting of a full basement level, a first floor and second floor. The building was constructed in 1916 and was originally used as an armory and housing for service members. In recent years, the building has remained vacant and unconditioned, allowing vast fluctuations in temperature and humidity. The building has experienced several roof leaks and water damage/water intrusion events over the years. Animals have nested in the building including rodents and pigeons; and large amounts of mold growth have proliferated over time, resulting in various biological hazards that will need to be mitigated before the building can be safely occupied.

3.2 Visual Observations

A thorough visual inspection was conducted throughout the building. Heavy water-damaged building materials were observed throughout the building. Past roof leaks have resulted in significant amounts of ceiling board and flooring material in the gym and main lobby to be heavily water damaged. Additionally, fluctuations in temperature and humidity have allowed heavy visible mold growth to proliferate on virtually all surfaces throughout the building. The basement level has very thick mushroom growths on the walls which takes a very large amount of moisture over a long period of time to occur. This is rarely seen in indoor environments. Rodent nesting/scat was observed in various areas throughout the building, as well as pigeon droppings and even dead pigeons/animals were found during the assessment. The building is heavily contaminated with mold/fungi, but bacteria, and viral particles should also be of concern based on the varying biological hazards present. Mold is a concern, but Hantavirus, histoplasmosis, *E. coli* and various other pathogens should be considered as biohazards as well.

3.3 Analytical Results

All air samples collected throughout the building were found to contain extremely high concentrations of airborne mold spores, atypical of healthy indoor environments. It is not advisable for persons to enter this building without respiratory protection, disposable suits, eye protection and gloves.

All surface samples collected were found to contain HEAVY concentrations of mold growth and contamination. This suggests widespread contamination throughout the building and reaffirms that all surfaces within the building will need to receive microbial decontamination/cleaning efforts.

4.0 Recommendations

1) Once all other regulated hazards have been removed from the building (i.e. asbestos, lead, PCB's, etc.) mold/bioremediation should be considered. This will require removal of all affected building materials throughout the building. This will likely require a complete removal of building materials down to the framing and original structure of the building. This will entail extensive removal of building materials. The owner should be privy to all decisions regarding removal of building materials. If any hazardous materials remain in the building, contractors should be briefed on its location and potential hazard in accordance with (V)OSHA HazCom regulation.

2) Once all affected building materials/items have been removed from the building, the building will require drying of materials utilizing LGR's to ensure excess moisture/humidity is removed from the structure. Once dried, HEPA filtered negative air machines should be installed in the basement of the building to draw air from the top floors, down through the basement and exhausted to the outdoors. There should be enough negative air machines in place to ensure a minimum of four (4) air exchanges per hour. This is imperative for removing mold spores from the building and preventing resettling/recontamination of mold spores on surfaces.

3) Cleaning operations should be performed in a top-down approach. This project is quite large and depending on the ability of the restoration company chosen, this may need to be broken into various phases. Cleaning should be performed on all surfaces utilizing the HEPA sandwich method. This is a succession of HEPA vacuuming, followed by thorough cleaning of surfaces utilizing a disinfectant solution, followed by a final HEPA vacuuming once surfaces have dried. It is imperative that all surfaces be thoroughly cleaned, as the level of contamination present is high enough where post-remediation air samples may fail if all surfaces are not thoroughly cleaned.

4) Once mold/bioremediation has been thoroughly performed, areas should be prepared for final visual inspections and air sampling. For a visual inspection to pass, all surfaces must be thoroughly cleaned from mold growth and any dirt, dust or debris. Air samples must be similar to outdoor types and concentrations in order to be deemed "clean."

5) In the future, it will be imperative to monitor and control temperature and humidity within the building. If this is not addressed by means of mechanical dehumidification and repair of water intrusion (i.e. roof leaks), mold will return. In general, relative humidity should be maintained below 50% year-round to inhibit mold growth/activity.

NOTE: It is important to ensure cleaning/disinfectant solutions are rated for broad spectrums of pathogens. This will ensure that cleaning/disinfecting will be effective against most pathogens within the building.

5.0 Disclaimers

It must be emphasized that the air sampling events represent a small snapshot in time on the day the samples were collected. Results can change dramatically as environmental conditions change, such as the weather or water episodes (floods, leaks, moisture intrusion, high relative humidity, etc.).

Once investigative work is underway, the requirements of the project may change based on findings that were inaccessible to the investigator at the time of the assessment. The remediation contractor is responsible for gearing the scope of the project and implementing appropriate engineering controls and work practices during the course of the project.

This mold report offers general guidelines and recommendations based on the assessment and experience of the Microbial Consultant. This is not intended to be a job-specific work plan. The work plan ensuring proper cleaning and successful remediation shall be the responsibility of the mold remediation contractor.

6.0 Signature

Dear NOBIS Group,

Thank you for choosing ECA, LLC to help you with your project. We are dedicated to quality customer service and satisfaction. If you have any questions regarding this report, or need additional environmental services in the future, please do not hesitate to contact me.

Best regards,

Christopher O. Clement, CMC, CIH

	Stachybotrys					
	Ulocladium like					
	Trichoderma					
Type III	*Alternaria*					
	Bipolaris/Drechslera					
	Curvularia					
	Epicoccum					
	Septonema- like					
	Pithomyces					
	Unidentified Fungi					

Note: Numeric values above in bold red print indicates elevated and/or "risky type" indoor airborne mold spore concentrations

Type I - Dominant outdoor molds that migrate into all indoor environments, but very rarely grow indoors
Type II - "Risky"molds associated with indoor moisture problems (when indoor levels are significantly higher than background levels)
Type III - Others - It is common to find a few of these mold spores in the outdoor and indoor air

McCRONE RESEARCH INSTITUTE

certifies that

Christopher Clement

has successfully completed an intensive course of instruction in

Indoor Air Quality: Fungal Spore Identification

given by the McCrone Research Institute

Presented this 20th day of April, 2012

Course Date: April 16-20, 2012

American Council for Accredited Certification

hereby certifies that

Christopher O. Clement

has met all the specific standards and qualifications of the re-certification process, including continued professional development, and is hereby re-certified as a

CMC

Council-certified Microbial Consultant

This certificate expires on September 30, 2021

Charles F. Wiles, Executive Director

1509006

Certificate Number

This certificate remains the property of the American Council for Accredited Certification.

ABIH®

american board of industrial hygiene®

organized to improve the practice of industrial hygiene
proclaims that

Christopher Owen Clement

having met all requirements of
education, experience and examination,
is hereby certified in the

COMPREHENSIVE PRACTICE
of
INDUSTRIAL HYGIENE

and has the right to use the designations

CERTIFIED INDUSTRIAL HYGIENIST

CIH

Certificate Number	**11562 CP**
Awarded:	**May 25, 2018**
Expiration Date:	**December 1, 2023**

Chair, ABIH

Chief Executive Officer, ABIH

APPENDIX G

APPENDIX G – ADDITIONAL LIMITATIONS

1) This hazardous materials survey was performed in accordance with generally accepted practices of other consultants undertaking similar work at the same time and in the same geographical area. The results of this survey are based on our professional judgment and are not scientific certainties. Specifically, KGSNE JV, LLC (KGSNE) does not and cannot represent that the site contains no hazardous materials or other latent conditions beyond those observed during this inspection. No other warranty, express or implied, is made.

2) The observations and conclusions presented in this report were made solely on the basis of conditions described thereon and not on scientific tasks or procedures beyond the scope of described services or the budgetary, time, and work constraints (i.e. restricted demolition/sampling) imposed by the client. The work described in this report was performed in accordance with the terms and conditions described in our agreement, and subsequent discussions in the field with facilities personnel.

3) During the Site inspection, observations were made of the site building. Where access to portions of the site building were unavailable, limited, or unsafe, KGSNE renders no opinion as to the presence of asbestos, lead, or other hazardous materials in those portions of the site.

4) No property boundary, site feature or topographic surveys of the site were performed by KGSNE.

5) Our services did not include assessments for the presence of pesticides, herbicides, urea-formaldehydes, or radon, nor any air quality monitoring, or any chemical analyses of soil, surface water, groundwater, or any other materials at the site beyond which is included in the report.

6) The purpose of this report was to inspect limited portions of the site building for the presence of suspect asbestos-containing materials, lead based paint, and PCB in bulk products within the context of applicable Occupational Safety and Health Administration (OSHA), USEPA (EPA), and the Vermont Department of Health regulations. This report does not in any manner or form constitute a Management Plan or Abatement Design within the context of OSHA, EPA, or Vermont Health regulations. No attempt was made to check the compliance of present or past owners of the site with federal, state, or local laws.

Eastern Analytical, Inc., Concord, NH
St. Johnsbury Armory
St. Johnsbury, VT

Tier 1 Plus Organic Data Review

PCBs
5/PCB Samples: P-1, P-2, P-3, P-4, P-5

Dear Mr. Byrne:

Nobis Group® performed a Tier 1 Plus data review on the organic analytical data for the samples listed above. The samples were collected by Nobis at the St. Johnsbury Armory located in St. Johnsbury, Vermont. The samples were analyzed by Eastern Analytical, Inc. under the subcontract with Nobis.

The Tier 1 Plus data review was performed in accordance with the EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures (June 2018); USEPA's Contract Laboratory Program National Functional Guidelines for Organic Superfund Methods Data Review (January 2017); and the Site-Specific Quality Assurance Project Plan Addendum (SSQAPPA) for the Former St. Johnsbury Armory Site (September 2020).

The data were evaluated based on the following parameters:

*	• Overall Evaluation of Data and Potential Usability Issues
*	• Data Completeness
*	• Preservation and Technical Holding Times
*	• Initial and Continuing Calibrations
*	• Blanks
NA	• Matrix Spike Analysis
NA	• Laboratory Duplicates
*	• Laboratory Control Samples (LCS)
NA	• Field Duplicates
*	• Surrogate Compounds
NA	• Performance Evaluation (PE) Samples

Nobis Group®
585 Middlesex Street
Lowell, MA 01851
T (978) 683-0891

* • Reported Quantitation Limits

* All criteria were met for this parameter.
NA – Not applicable.

Overall Evaluation of Data and Potential Usability Issues
The objective of the building material sample collection was to the presence/absence of PCBs in building materials and their respective concentrations for the purposes of evaluating potential renovation costs.

The data meet the project quality criteria and can be used without restriction. The attachments provide details and supporting documentation.

PCBs:
None of the analytical results were qualified and are considered to be acceptable for use without restriction.

Please contact Bridget Fortier at (978) 399-9651 or bfortier@nobis-group.com should you have any questions or comments regarding this information.

Sincerely,

NOBIS GROUP®

Bridget Fortier, E.I.T.

APPENDIX A

Generic Data Review Checklist

Project: St. Johnsbury Armory, St. Johnsbury VT
Project #: 93203.11
Case#: 221858
Date: 2/25/2020
Methods: Polychlorinated Biphenyls by Gas Chromatography
Laboratory: Eastern Analytical Inc.
SDG: --
Reviewer: Bridget Fortier

1. **Case Narrative and Data Package Completeness (COC and Analyte List Review):**
   All requested analyses were provided. The analyte lists were complete. – No Action

2. **Holding Time and Sample Preservation Compliance:**
   All samples were received and tested within the appropriate holding times. All the samples were shipped and stored with the appropriate preservation. – No Action

3. **Lab and Field Blanks**
   No laboratory blank samples were collected for this project. – No Action
   No field blanks were collected for this project. – No Action

4. **Laboratory Control Samples**
   No LCS were taken for this project. – No Action

5. **Field Duplicate Precision**
   No field duplicates were collected for this project. – No Action

6. **Laboratory Duplicate Precision**
   No Laboratory Duplicates were collected for this project. – No Action

7. **Matrix Spikes**
   No Matrix Spikes were collected for this project. – No Action

8. **Surrogate Spikes**
   Surrogate spikes recoveries all within limits. – No Action

9. **Internal Standards**
   Internal standards data was not included in the laboratory report. – No Action

10. **Performance Evaluation Samples**
    No performance evaluation samples were submitted for this project. – No Action

11. **Reporting Limits**
    The reporting limits for these samples were below the project action limits. – No Action

12. Calibration Issues

There were no calibration issues. – No Action

13. Other

There were no other concerns for this project.

EXECUTIVE SUMMARY

KGSNE JV II, LLC (KGSNE) has completed a Targeted Brownfields Assessment (TBA) at the St. Johnsbury Armory located at 1249 Main Street, St Johnsbury, Vermont (the Site) for the U.S. Environmental Protection Agency (EPA) under Contract No. 68HE0122D0001, Task Order No. 68HE0122F0044, Site No. 68HE0122F0044-13. TBA activities were performed to address data gaps identified by Atlas Technical Consultants (Atlas). The supplemental data will be used by the Town of St. Johnsbury and its contractor Montrose Environmental Group Inc. (Montrose) to further define the distribution of hazardous materials in support of cleanup planning and materials abatement for future building renovation and reuse or demolition and disposal.

The Former Armory building is a 2-story 5,600 (+/-) square foot building that was constructed in 1916. The building has served as an armory, gymnasium, and meeting house throughout its history. The building has remained vacant and unused for several years, leading to extensive mold growth and damage to various building materials.

On March 20, 2023, Atlas developed a Workplan for Additional Hazardous Building Materials Sampling (Atlas, 2023; the workplan). This plan was developed based on the previous assessments, and called for additional polychlorinated biphenyl (PCB) and asbestos sampling, as well as sub-slab soil sampling and lead waste characterization sampling. This workplan was the basis of sampling for this TBA investigation.

KGSNE performed TBA field investigation activities between August and December 2023. KGSNE oversaw the completion of the Phase I hazardous building material survey on August 14 through 16, 2023 that included the collection of asbestos containing materials and polychlorinated biphenyls (PCB) paints and coatings. KGSNE collected sub-slab soil samples on August 17, 2023. On October 2, 2023 KD Associates returned to the Site to collect bulk building material samples for PCBs. Additional building materials were sampled by KGSNE on December 3, 2023.

Phase II began on October 25, 2023. KD Associates sampled various paint locations for waste characterization, as well as additional building material samples where high PCB paint concentrations were found from Phase I. On November 1 and 2, 2023, KGSNE collected soil samples from 24 locations next to high PCB paint locations in order to confirm and delineate PCB migration into the subsurface.

1.0 INTRODUCTION

KGSNE JV II, LLC (KGSNE) has completed a Targeted Brownfields Assessment (TBA) at the St. Johnsbury Armory located at 1249 Main Street, St Johnsbury, Vermont (the Site) for the U.S. Environmental Protection Agency (EPA) under Contract No. 68HE0122D0001, Task Order No. 68HE0122F0044, Site No. 68HE0122F0044-13. Work was performed in general accordance with the procedures and quality control measures detailed in the Program Quality Assurance Project Plan (Program QAPP) prepared by KGSNE and approved by EPA on October 27, 2022 (KGSNE 2022), the Quality Assurance Project Plan Addendum (QAPPA) prepared by KGSNE (KGSNE 2023a), and the QAPPA Update prepared by KGSNE (KGSNE 2023b). This report presents the findings of the TBA field investigation activities conducted by KGSNE between August and December 2023. A Site Locus Map is included as Figure 1-1.

1.1 Project Objectives

The overall objective of the TBA is to perform a supplemental hazardous building material survey (HBMS) at the Site to address data gaps identified by Atlas Technical Consultants (Atlas). The supplemental data will be used by the Town of St. Johnsbury and its contractor Montrose Environmental Group Inc. (Montrose) to further delineate the distribution of hazardous materials to support future building renovation and reuse or demolition and disposal. Other common HBM were delineated in previous investigations. TBA activities were split into two phases. Phase I consisted of collection of suspected asbestos containing materials (ACMs), and multi-media samples suspected of containing polychlorinated biphenyls (PCBs) including bulk building materials, paints, and sub-slab soils. Phase II, which was based on the results of Phase I, consisted of lead-based paint samples for waste characterization, further building material sampling for PCBs, and soil sampling for PCBs.

1.2 Site Background

This section describes the physical characteristics of the Site as well as the environmental history of the Site.

1.2.1 Site Location and Description

The Former Armory building is a 2-story 5,600 (+/-) square foot building that was constructed in 1916. The building has served as an armory, gymnasium, and meeting house throughout its history. The building has remained vacant and unused for several years, leading to extensive mold growth and damage to various building materials.

1.3 Previous Investigations

There have been four previous Site investigations:

Limited Interior Asbestos Inspection – Crothers Environmental Group LLC, November 1, 2008: This assessment was an initial building materials survey for asbestos.

Environmental Survey – Cardno ATC, March 28, 2013: This assessment included inventory and sampling of asbestos, PCBs, lead-based paint, lead dust, mold testing, and a floor drain investigation.

PCB Building Material Survey – ATC Group Services LLC, March 3, 2017: This assessment included additional PCB sampling of building materials, indoor air, and the concrete floor slab.

Targeted Brownfields Assessment Report – KGSNE, LLC, March 29, 2021: This assessment included additional PCB and asbestos sampling, lead paint testing, a regulated/universal waste survey, and mold survey and sampling.

On March 20, 2023, Atlas developed a Workplan for Additional Hazardous Building Materials Sampling (Atlas, 2023). This plan was developed based on the previous assessments, and called for additional PCB and asbestos sampling, as well as sub-slab soil sampling and lead waste characterization sampling. This workplan was the basis of sampling for this TBA investigation.

2.0 TBA INVESTIGATION ACTIVITIES

KGSNE performed TBA field investigation activities between August and December 2023, in general accordance with the QAPPA (KGSNE, 2023a) and QAPPA Update (KGSNE, 2023b). KGSNE oversaw the completion of the Phase I HBMS on August 14 through 16, 2023 that included the collection of ACM and PCB paints and coatings. KGSNE collected sub-slab soil samples on August 17, 2023. On October 2, 2023 KD Associates returned to the Site to collect bulk building material samples for PCBs. Additional building materials were sampled by KGSNE on December 3, 2023 to replace samples that could not be analyzed initially due to matrix interference issues. A copy of KD Associates' report summarizing findings from Phase I is included as Appendix A.

Phase II began on October 25, 2023. KD Associates sampled various paint locations for waste characterization, as well as additional building material samples where high PCB paint concentrations were found from Phase I. On November 1 and 2, 2023, KGSNE collected soil samples from 24 locations next to high PCB paint locations in order to confirm and delineate PCB migration into the subsurface.

2.1 PCB Paints and Coatings

From August 14 through 18, 2023 KGSNE mobilized to the Site with KD Associates to sample PCB paints and coatings for Phase I throughout the interior and exterior of the building. Samples were collected from pre-determined locations identified by the Atlas workplan and as directed by Montrose. Several materials listed for sampling in the workplan were determined by KGSNE, Montrose, and KD Associates to not exist (such as doors or underlying plasters) and were not sampled. Four additional samples of Celotex board in the gym which were not originally identified were sampled. On October 18, 2023 KD Associates returned to the Site to collect samples from suspect substrate materials or materials subject to potential leaching of PCBs, particularly concrete window sashes. On December 4, 2023 KGSNE returned to the Site to collect subsequent samples.

The following is a breakdown of the samples collected from each area of the building:

Location	Total PCB Paints/Coating Samples Collected
Second Floor	48
First Floor	94
Basement	96
Exterior	40

Paint and coating samples were collected using tools and scrapers that were decontaminated with a diluted hexane spray and deionized water between locations. KGSNE confirmed with the laboratory that only 2 grams of material were needed for analysis but attempted to collect 10 grams of material where possible. Samples were weighed in the field to ensure proper sample volume.

Samples were transmitted to Pace Analytical Laboratory (Pace) of East Longmeadow, Massachusetts and were analyzed for PCBs using Method 8082 with Soxhlet Extraction. Sample information and results are listed in Table 2-1 and shown on Figures 2-1a, 2-1b, 2-1c, and 2-1d. Laboratory reports are included in Appendix B.

2.2 Lead Based Paint

Based on results from Phase I, Montrose provided instructions on sample collection requirements for Phase II sampling. On October 25, 2023 KD Associates collected five composite samples for lead waste characterization as part of Phase II. Each composite sample consisted of lead paint from five locations that were chosen by Montrose based on the PCB and asbestos results to

accurately characterize the lead concentrations in the different waste streams. Lead paint samples were collected using hand tools and scrapers that were decontaminated between locations.

Waste characterization samples were transmitted under a chain-of-custody to Pace. Samples were analyzed for toxic characteristic leaching procedure (TCLP) lead. Sample locations and results are listed in Table 2-2 and shown on Figures 2-1a, 2-1b, 2-1c, and 2-1d. Laboratory reports are included in Appendix B.

2.3 Asbestos Containing Materials

KD Associates' Vermont-certified asbestos inspectors conducted the asbestos survey during the week of August 14, 2023. Samples were collected from pre-determined locations identified by Atlas. Several materials listed for sampling in the workplan were determined to not exist and were not sampled. Additional materials that were likely to contain asbestos were identified by KD Associates, KGSNE, and Clay Point Associates Inc. (Clay Point) (a subcontractor of Montrose) during the investigation and were also sampled.

A total of 97 samples were collected from suspect bulk building materials for laboratory analysis for asbestos. Multiple samples were collected from homogeneous areas identified throughout the building to identify asbestos content. Homogeneous areas consist of areas that appear to be similar in material color, texture, and date of installation or application. The samples were spread across 45 homogeneous areas.

The Atlas workplan called for the sampling of material that might exist behind the brick façade of the building and included the removal of brick on the exterior to investigate said possible materials. KD Associates attempted to reach materials behind the façade by removing bricks from one location on the north, west, and south sides of the building. The façade unexpectedly contained three layers of brick arranged in an offset pattern that would require removal of several bricks on the outermost layer in order to successfully remove bricks in the innermost layers. Montrose decided to not continue this exploration so as not to damage the historical façade.

The workplan had additionally called for investigation behind the vent covers in Rooms 7 and 15 to evaluate suspect materials behind them. Upon further investigation, the vents were actually determined to be drain chases from the bathrooms, and no covers were present. Montrose indicated that no samples needed to be collected from the drain chases.

Samples of drywall and joint compound were selected to be sampled from several rooms throughout the building in the Atlas workplan. KD Associates and Clay Point moved or eliminated several of the samples for more spatial coverage of different materials.

Bulk samples were transmitted under a chain-of-custody to EMSL Analytical, Inc. (EMSL), an accredited Vermont-certified laboratory located at 5 Constitution Way, Unit A in Woburn, Massachusetts. Samples were analyzed by polarized light microscopy (PLM) in accordance with the EPA "Method for Determination of Asbestos in Bulk Material"; EPA/600/R-93/116 (EPA, 1993). Any materials found to contain <2% asbestos by PLM analysis were analyzed via 400-point count.

Non-friable organically bound (NOB) samples were analyzed using via PLM with gravimetric reduction. Transmission Electron Microscopy (TEM) was used to confirm PLM results if PLM testing found NOB materials to be negative for asbestos content.

Each set of homogeneous bulk samples was analyzed using the "hit-stop" procedure. Per this procedure, analysis of additional duplicate samples collected from identical materials is not required if asbestos is detected in any one of the samples from the homogeneous group.

Sample locations and results are listed in Table 2-3 and shown on Figures 2-2a, 2-2b, 2-2c, and 2-2d. Laboratory reports are included in Appendix B.

2.4 PCB Bulk Material Sampling

On October 2, 2023, KD Associates returned to the Site to sample bulk building materials for PCB analysis. Samples were collected from pre-determined locations identified by Atlas. Several materials listed for sampling in the workplan were determined to not exist and were not sampled. Per the workplan, three samples of each material were collected.

Building material samples were collected using tools and scrapers that were decontaminated with a diluted hexane spray and deionized water between locations. Samples were submitted to Pace and were analyzed for PCBs using Method 8082 with Soxhlet Extraction. Sample locations and results are listed in Table 2-4 and shown on Figures 2-2a, 2-2b, 2-2c, and 2-2d. Laboratory reports are included in Appendix B.

2.5 Sub-Slab Sampling

On August 17, 2023 KGSNE oversaw the coring of concrete through the basement slab and collected five soil samples for PCB analysis from beneath the basement concrete floor. Cascade Environmental (Cascade) of Barre, Vermont first cleared the sample area of the concrete floor in the basement with a wire brush, making sure to scrape away any paint on the concrete floor. The area was wiped down with a rag. Cascade used a 4-inch concrete core drill with water to core

through the concrete slab to the soil below. A wet-vac was used during coring to ensure slurry did not penetrate the soil below. Once the core had been removed, KGSNE collected the soil sample using a decontaminated trowel. Samples were collected from Room 23, Room 27, Room 25A, Room 21, and Room 31. In general, concrete slab thickness was observed by field staff to be approximately 6 inches.

Soil samples were submitted to Pace under chain-of-custody. Samples were analyzed for PCBs using Method 8082 with Soxhlet Extraction. Sample results are listed in Table 2-5 and locations are shown on Figure 2-3. Laboratory reports are included in Appendix B.

2.6 Exterior Soil Sampling

On November 1 and 2, 2023, KGSNE oversaw the advancement of 24 soil borings around the exterior of the building. The locations were predetermined by Montrose based on high PCB results in Phase I materials samples. The samples were completed to evaluate potential presence of shallow soil contamination. Drilex Environmental (Drilex) used a hand-held Geoprobe and hammer drill to advance each boring. Soil samples were collected in 0.5-foot intervals to a depth of 5 feet below ground surface (bgs), and then in one-foot intervals from depths between 5 and 8 feet bgs. Samples were collected using a dedicated 24-inch acetate macro-core sampling sleeve. KGSNE visually classified soils in the field using the Modified Burmister Classification System. Soil descriptions and other pertinent subsurface observations are presented on boring logs included in Appendix C.

Sample location P-328-Ex was advanced through the concrete steps on the north side of the building. Below the steps was a void approximately 6 feet deep before soil was encountered. Drilex was able to advance a boring into the underlying dirt, but only to 12 feet bgs below the top of the step, as this was the depth limit of the tooling. KGSNE collected samples every 0.5 foot from 6 feet below the step to 11 feet below the step (the top 5 feet of the boring) and collected one 1-foot interval from 11 to 12 feet below the step.

One boring was supposed to be advanced into the soil underneath the concrete landing pad at the bottom of the northern basement steps. Drilex attempted this location but was still in concrete after 2 feet of drilling, which is the limit of the hammer drill bit. Montrose instructed KGSNE to drill through the first step above the landing to determine if the pad extended in that direction. Drilex reached the same 2 foot depth into the pad, and Montrose instructed KGSNE to skip this location.

Soil samples were submitted to Pace under chain-of-custody. Samples were analyzed for PCBs using Method 8082 with Soxhlet Extraction. Only the top interval (0-0.5 feet bgs) samples from

each location were initially submitted for analysis; all other samples were placed on hold at the laboratory and analyzed as needed given the results of the shallower samples. Sample locations and results are listed in Table 2-5 and shown on Figure 2-3. Laboratory reports are included in Appendix B.

3.0 DATA USABILITY AND VALIDATION

KGSNE performed a Tier 1 Stage 2A manual data review (S2AVM) on the organic and inorganic analytical data collected during the TBA. The Tier 1 Stage 2A manual data review was performed in accordance with the Region 1 - EPA New England Environmental Data Review Supplement for Region 1 Data Review Elements and Superfund Specific Guidance/Procedures (EPA, 2020a); USEPA's National Functional Guidelines for Organic Superfund Methods Data Review (EPA 2020b); USEPA's National Functional Guidelines for Inorganic Superfund Methods Data Review (EPA 2020c); the Program QAPP (KGSNE, 2022) (RFA# 12263), dated October 2022, and the QAPPA (KGSNE, 2023a) for the St. Johnsbury Armory Site, which appends the October 2022 Program QAPP.

Data were evaluated based on the following parameters: overall evaluation of data and potential usability issues, data completeness, preservation and technical holding times, blanks, surrogates (organic analyses only), internal standards, matrix spike analysis, laboratory duplicates, laboratory control samples (LCS), field duplicates, ICP serial dilutions (metals only), target analyte identification, and reported quantitation limits.

In general, the data meets the project quality criteria and can be used without restriction. Qualified results are noted in the data summary tables. Limitations and qualification of the data were noted and explained in the data review memorandum provided in Appendix D.

4.0 SUMMARY OF TBA SAMPLING RESULTS

KGSNE performed a review of the sampling data generated during the TBA investigation. A brief summary of the laboratory analytical results is presented below.

4.1 PCB Paints and Coatings

KGSNE submitted 278 PCB paint samples, plus additional quality control samples. Samples that had greater than 50 parts per million (ppm) of total PCBs were used by Montrose to determine sample locations for Phase II sampling. Below is a summary of the PCB paint and coating results:

Location	Total PCB Paints/Coating Samples Collected	Total Samples Exceeding 50 ppm of PCBs
Second Floor	48	8
First Floor	94	8
Basement	96	65
Exterior	40	11

Analytical laboratory reports are included as Appendix B. Soil analytical results are presented in Table 2-1. Figures 2-1a, 2-1b, 2-1c, and 2-1d depict the sample locations.

4.2 Lead Based Paint

Five composite samples were submitted for lead TCLP for waste characterization. Results ranged from 0.21 milligrams per liter (mg/L) to 28 mg/L. Analytical laboratory reports are included as Appendix B. Lead analytical results are presented in Table 2-2. Figures 2-1a, 2-1b, 2-1c, and 2-1d depict sample locations.

4.3 Asbestos Containing Materials

KGSNE submitted 97 ACM samples from 45 homogenous areas, plus additional quality control samples. Each set of homogeneous bulk samples was analyzed using the "hit-stop" procedure. Per this procedure, analysis of additional duplicate samples collected from identical materials is not required if asbestos is detected in any one of the samples from the homogeneous group.

ACMs identified during the HBMS include:

- White caulking along the roof of the building;
- Flashing caulk on the southwest loading ramp roofline;
- Light gray caulking along the roof-chimney join;
- Built up tar paper on the gambrel roof;
- Asphalt layer on the gambrel roof;
- Joint compound in Rooms 6 and 7;
- Black mastic in Room 18;
- Gray adhesive behind the faux wood wall paneling in Room 5;
- Silver paint on the metal roof of the southwest loading dock; and
- Built up roofing under the flat roof.

Samples that returned positive results for the presence of asbestos are presented on Table 2-3. Laboratory analytical data for asbestos analysis is included in Appendix B. Sample locations are presented in Figures 2-2a, 2-2b, 2-2c, and 2-2d.

4.4 PCB Bulk Materials

KGSNE submitted 24 bulk building materials for PCB analysis. Bulk samples that returned positive results for PCBs are presented on Table 4-4. Laboratory analytical data for PCB analysis is included in Appendix B. Sample locations are presented in Figures 2-2a, 2-2b, 2-2c, and 2-2d.

4.5 Sub Slab Sampling

KGSNE submitted five soil samples collected from beneath the slab of the building foundation. No PCBs were detected in any of the samples. PCB soil analytical results are presented on Table 2-5. Sample locations are shown on Figure 2-3. Analytical laboratory reports are included as Appendix B.

4.6 Exterior Soil Sampling

KGSNE submitted 24 soil samples from borings advanced on the exterior of the building for PCB analysis. Over 280 samples collected from subsequent depths were also submitted to the laboratory and placed on hold, pending results of the initial sample analyses. The following locations reported PCB detections in the 0-0.5 foot interval and had deeper intervals analyzed;

- P-308-Ex had one additional interval analyzed
- P-313-Ex had two additional intervals analyzed
- P-314-Ex had one additional interval analyzed
- P-315-Ex had two additional intervals analyzed
- P-316-Ex had one additional interval analyzed
- P-321-Ex had one additional interval analyzed
- P-323-Ex had one additional interval analyzed
- P-326-Ex had one additional interval analyzed

In total, 34 soil samples were analyzed from the borings.

The highest concentrations of PCBs were detected in samples collected from boring P-315-Ex. Total PCBs were reported at a concentration of 4.4 ppm in the 0-0.5 foot sample. Total PCBs were reported at a concentration of 1.3 ppm in the 0.5-1.0 foot sample, and at a concentration of 0.097

ppm in the 1-1.5 foot sample. P-315-Ex is located to the west of the southwest loading ramp structure.

No other soil samples analyzed reported concentrations exceeding 1 ppm total PCBs.

Soil analytical results are presented on Table 2-5. Sample locations are shown on Figure 2-3. Analytical laboratory reports are included as Appendix B.

5.0 CONCLUSIONS

KGSNE has completed this TBA at the St. Johnsbury Armory located at 1249 Main Street, St. Johnsbury, Vermont for the EPA. The overall objective of the TBA was to perform a supplemental HBMS at the Site to address data gaps identified by Atlas, and to conduct subsequent sampling as requested by Montrose.

The results of this HBMS have identified additional materials at the Site that require consideration for future redevelopment activities, including:

- PCBs in paint, caulk, and other bulk building materials;
- PCBs in exterior soil; and
- Asbestos in various building materials including caulk, mastic, roofing, paint, and joint compound.

The supplemental data will be used by Montrose to further define the distribution of hazardous materials in support of cleanup planning and materials abatement for future building renovation and reuse or demolition and disposal.

Notes:
Material IDs and Room numbers from Atlas Technical Consultants *Workplan for Additional Hazardous Building Materials Sampling* , 2023
LF = linear feet
SF = square feet
'--' = indicates all results for that sample were non-detect.
All results reported in ppm
J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the samples.
Red shading indicates the material did not exist
Tan shading indicates the material contains a total PCB concentration over 50 ppm
Gray shading indicates the material was not selected to be sampled in the original sample plan by Atlas. The materials are still shown in the Atlas Workplan tables and were carried over for continuity.

Notes:
Material IDs and Room numbers from Atlas Technical Consultants *Workplan for Additional Hazardous Building Materials Sampling* , 2023
LF = linear feet
SF = square feet
All results reported in ppm
Red shading indicates the material did not exist
Tan shading indicates the material contains a total PCB concentration over 50 ppm
J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the samples.

Notes:
All results reported in ppm
The intervals at the end of the KGSNE Sample ID correspond to the depth interval, in feet (eg 000.5 corresponds to 0-0.5 interval)
J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the samples.

4.0 DATA EVALUATION MEMORANDA

INTRODUCTION

Nobis Engineering, Inc. (Nobis) retained K-D Associates, Inc. (KDAI) to conduct additional sampling of suspect building materials as described in the Work Plan for Additional Hazardous Materials Sampling, dated February 21. 2023 and revised March 20, 2023, prepared by Atlas Technical Consultants. Additional guidance and sampling protocols were provided by the Quality Assurance Project Plan Addendum for St. Johnsbury Armory dated July 10, 2023.

The scope of work addressed in this report includes the collection of specific bulk samples of suspect asbestos containing building materials to be tested for asbestos and additional suspect building materials and surface coatings to be tested for polychlorinated biphenyls (PCBs), at the former St. Johnsbury Armory, 1249 Main Street, St. Johnsbury, Vermont. This sampling is being conducted as a supplement and follow-up to previous sampling at this building and is not intended to be a comprehensive assessment on its own. Field operations, inspection activities and sample collection have been conducted by qualified and certified environmental professionals in accordance with the standard operating procedures identified in the QAPP prepared by KGSNE JV II, LLC. Field work to collect the bulk samples was conducted on August 14, 15, and 16, 2023 with additional sampling on October 25, 2023.

Sub-slab sampling of soil for PCB's, described in the Scope of Work, was conducted by a separate company, and is not included as part of this report.

Asbestos

Additional suspect building materials to be sampled for asbestos were previously identified and tabulated in Table 3 of the Atlas Work plan to supplement the asbestos assessment work previously completed. Oversight, as well as direction on additional sample collection, was provided by ClayPoint Associates, Inc. while on-site. Exploratory investigation was made behind the brick façade of the building to assess potential hidden suspect asbestos containing materials in two locations on both the East and West sides of the building. No additional suspect materials were observed within the wall structure.

K-D Associates, Inc was assisted in the collection of roof samples by Rodd Roofing, who patched and repaired all roof penetrations and provided access to materials above ground level.

Polychlorinated Biphenyls (PCBs)

PCB source materials sampling (Phase 1) was conducted to supplement previous source sampling completed by a separate firm. The required sampling is described in Section 5 of the report prepared by Atlas Technical Consultants.

Exclusions

K-D Associates, Inc. endeavored to conduct a thorough sampling of the required materials and all additional materials identified in the field that were not previously sampled. Additional limitations may have impacted our ability to inspect all locations such as poor lighting, height constraints, unusual building features and stored materials that block access to suspect materials.

Our sampling addressed building materials not sampled as part of the previous asbestos inspections. This assessment did not attempt to identify all suspect asbestos containing building materials as this was beyond our Scope of Work.

This report includes the results of the laboratory analysis for the samples collected along with a comparison to relevant regulatory limits which can impact future renovation/demolition activities. This report does not intend to provide guidance on meeting any regulatory or reporting requirements potentially initiated by these findings.

1.0 Asbestos Containing Building Materials

1.1 Scope of Work - Multiple samples of each selected homogenous building material were collected using hand tools to remove and place suspect material in a separate and clean sampling bag for transport to the laboratory. Apart from the roofing materials and exterior caulking, sampling locations did not require repair. The number and location of samples, for each suspect material, was prescribed by the Scope of Work and Quality Assurance Plan. Two exploratory removals of the brick façade were made on the Eastern and Western sides of the building. These removals were repaired with an appropriate cement patch material for exterior masonry. 100 bulk samples of suspect asbestos containing building material were collected and submitted to EMSL Analytical, Inc. for analysis via AHERA Method 40CFR 763 Subpart E, Appendix E Supplemented with EPA 600/R-93/116 using Polarized Light Microscopy. For each homogeneous sampling group, the laboratory analyzed samples until a positive result was obtained (i.e. greater than one percent asbestos) or until all samples were analyzed. If one sample indicates an asbestos content greater than one percent, the entire homogenous area must be considered to be an ACM.

1.2 Finding

1.3 Asbestos Conclusions - As part of this assessment, asbestos was found to be present at a concentration greater than 1%, in 10 of the building materials sampled. In general, these materials include adhesive paneling, mastic on floors, joint compound on walls and ceilings exterior caulking, and exterior roofing materials at various locations. The Environmental Protection Agency (EPA), Vermont Occupational Safety and Health Administration (VOSHA), and the Vermont Department of Health (VDOH) have established rules and regulations affecting any operations that may affect asbestos containing materials including renovation or demolition activities.

2.0 POLYCHLORINATED BIPHENYLS (PCBs)

2.1 Scope of Work - For each homogenous paint/coating and sealant material identified for PCB sampling, a minimum of 10 grams of material were collected. The collection surface was first cleaned with a wetted paper towel to remove dust or surface grime. Samples were collected of the full thickness of wall paint (all layers). Sample locations were identified with a unique sampling number and a photograph taken to further document the location. Exterior caulking sample locations were repaired with appropriate grey caulking sealant.

Sampling tools were decontaminated between samples by first removing gross contamination, and then performing a final wipe using a clean hexane wetted paper towel. Samples were placed in a 4 oz amber colored glass jar for transport to the laboratory. Custody of samples was transferred directly to Nobis Group for transport to a laboratory under a

chain-of-custody. Samples were submitted for analysis to Con-Test via EPA 3540C Soxhlet Extraction method and SW-846 8082 Arcolor analytical method.

Quality control samples collected included field duplicates and matrix spike duplicates were collected and submitted in accordance with the 1 per 20 duplicate frequencies.

2.3 PCB Conclusions - PCB's in a concentration greater than 50 ppm were found to be present in a significant number of the bulk samples collected. EPA regulations implementing the Toxic Substances Control Act (TSCA) prohibit the use of PCBs in caulk and other building materials manufactured with PCBs at levels greater than or equal to 50 ppm, including the continued use of such materials that are already in place.

CASE NARRATIVE SUMMARY

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

SW-846 8082A

Qualifications:

MS-21

Matrix spike and/or spike duplicate recovery bias high due to contribution of other Aroclors present in the source sample.

Analyte & Samples(s) Qualified:

Aroclor-1016
B350677-MS1, B350677-MSD1

Aroclor-1016 [2C]
B350677-MS1, B350677-MSD1

Aroclor-1260
B350677-MS1, B350677-MSD1

Aroclor-1260 [2C]
B350677-MS1, B350677-MSD1

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.
I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
MS-21	Matrix spike and/or spike duplicate recovery bias high due to contribution of other Aroclors present in the source sample.

CASE NARRATIVE SUMMARY

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.
I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level

Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.

No results have been blank subtracted unless specified in the case narrative section.

CASE NARRATIVE SUMMARY

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

SW-846 8082A

Qualifications:

MS-21

Matrix spike and/or spike duplicate recovery bias high due to contribution of other Aroclors present in the source sample.

Analyte & Samples(s) Qualified:

Aroclor-1016
B350795-MS1, B350795-MSD1

Aroclor-1016 [2C]
B350795-MS1, B350795-MSD1

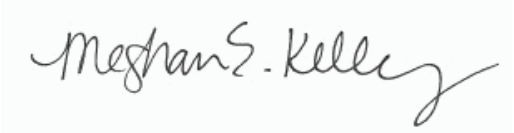
Aroclor-1260
B350795-MS1, B350795-MSD1

Aroclor-1260 [2C]
B350795-MS1, B350795-MSD1

S-01

The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

Analyte & Samples(s) Qualified:



Decachlorobiphenyl
23H3253-09[P-049-R18S], 23H3253-11[P-051-R18NC], 23H3253-13[P-053-R20E], 23H3253-14[P-054-R20W], 23H3253-15[P-055-R20NB], 23H3253-16[P-056-R20NC], 23H3253-19[P-059-R21S]

Decachlorobiphenyl [2C]
23H3253-09[P-049-R18S], 23H3253-11[P-051-R18NC], 23H3253-13[P-053-R20E], 23H3253-14[P-054-R20W], 23H3253-15[P-055-R20NB], 23H3253-16[P-056-R20NC], 23H3253-19[P-059-R21S]

Tetrachloro-m-xylene
23H3253-09[P-049-R18S], 23H3253-11[P-051-R18NC], 23H3253-13[P-053-R20E], 23H3253-14[P-054-R20W], 23H3253-15[P-055-R20NB], 23H3253-16[P-056-R20NC], 23H3253-19[P-059-R21S]

Tetrachloro-m-xylene [2C]
23H3253-09[P-049-R18S], 23H3253-11[P-051-R18NC], 23H3253-13[P-053-R20E], 23H3253-14[P-054-R20W], 23H3253-15[P-055-R20NB], 23H3253-16[P-056-R20NC], 23H3253-19[P-059-R21S]

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.
I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
MS-21	Matrix spike and/or spike duplicate recovery bias high due to contribution of other Aroclors present in the source sample.
S-01	The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

CASE NARRATIVE SUMMARY

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

SW-846 8082A

Qualifications:

MS-21

Matrix spike and/or spike duplicate recovery bias high due to contribution of other Aroclors present in the source sample.

Analyte & Samples(s) Qualified:

Aroclor-1016
B351006-MS1, B351006-MSD1

Aroclor-1016 [2C]
B351006-MS1, B351006-MSD1

Aroclor-1260
B351006-MS1, B351006-MSD1

Aroclor-1260 [2C]
B351006-MS1, B351006-MSD1

S-01

The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

Analyte & Samples(s) Qualified:

Decachlorobiphenyl
23H3255-09[P-069-R22EC], 23H3255-11[P-071-R22WB], 23H3255-12[P-072-R2D], 23H3255-14[P-074-R23EC], 23H3255-16[P-076-R23EWT], 23H3255-17[P-077-R23W], 23H3255-18[P-078-R23N], 23H3255-19[P-079-R23D], B351006-MS1, B351006-MSD1

Decachlorobiphenyl [2C]
23H3255-09[P-069-R22EC], 23H3255-11[P-071-R22WB], 23H3255-12[P-072-R2D], 23H3255-14[P-074-R23EC], 23H3255-16[P-076-R23EWT], 23H3255-17[P-077-R23W], 23H3255-18[P-078-R23N], 23H3255-19[P-079-R23D], B351006-MS1, B351006-MSD1

Tetrachloro-m-xylene
23H3255-09[P-069-R22EC], 23H3255-11[P-071-R22WB], 23H3255-12[P-072-R2D], 23H3255-14[P-074-R23EC], 23H3255-16[P-076-R23EWT], 23H3255-17[P-077-R23W], 23H3255-18[P-078-R23N], 23H3255-19[P-079-R23D], B351006-MS1, B351006-MSD1

Tetrachloro-m-xylene [2C]
23H3255-09[P-069-R22EC], 23H3255-11[P-071-R22WB], 23H3255-12[P-072-R2D], 23H3255-14[P-074-R23EC], 23H3255-16[P-076-R23EWT], 23H3255-17[P-077-R23W], 23H3255-18[P-078-R23N], 23H3255-19[P-079-R23D], B351006-MS1, B351006-MSD1

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.
I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
MS-21	Matrix spike and/or spike duplicate recovery bias high due to contribution of other Aroclors present in the source sample.
S-01	The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

CASE NARRATIVE SUMMARY

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

SW-846 8082A

Qualifications:

MS-21

Matrix spike and/or spike duplicate recovery bias high due to contribution of other Aroclors present in the source sample.

Analyte & Samples(s) Qualified:

Aroclor-1016
B351007-MS1, B351007-MSD1

Aroclor-1016 [2C]
B351007-MS1, B351007-MSD1

Aroclor-1260
B351007-MS1, B351007-MSD1

Aroclor-1260 [2C]
B351007-MS1, B351007-MSD1

S-01

The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

Analyte & Samples(s) Qualified:

Decachlorobiphenyl
23H3256-01[P-081-R22SB], 23H3256-02[P-082-R24E], 23H3256-03[P-083-R24SC], 23H3256-04[P-084-R24SB], 23H3256-05[P-085-R24W], 23H3256-06RE1[P-086-R25E], 23H3256-07[P-087-R25S], 23H3256-10RE1[P-090-R25AE], 23H3256- 11[P-091-R25AS], 23H3256-18RE1[P-098-R24AW], 23H3256-19[P-099-R24AN], 23H3256-20[P-100-R24AC], B351007-MS1, B351007-MSD1

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
MS-21	Matrix spike and/or spike duplicate recovery bias high due to contribution of other Aroclors present in the source sample.
S-01	The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

CASE NARRATIVE SUMMARY

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

SW-846 8082A

Qualifications:

MS-21

Matrix spike and/or spike duplicate recovery bias high due to contribution of other Aroclors present in the source sample.

Analyte & Samples(s) Qualified:

Aroclor-1016
B351008-MS1, B351008-MSD1

Aroclor-1016 [2C]
B351008-MS1, B351008-MSD1

Aroclor-1260
B351008-MS1, B351008-MSD1

Aroclor-1260 [2C]
B351008-MS1, B351008-MSD1

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.
I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
MS-21	Matrix spike and/or spike duplicate recovery bias high due to contribution of other Aroclors present in the source sample.

ANALYTICAL SUMMARY

WORK ORDER NUMBER: 23H3258

The results of analyses performed on the following samples submitted to CON-TEST, a Pace Analytical Laboratory, are found in this report.

PROJECT LOCATION: St. Johnsbury, VT

FIELD SAMPLE #	LAB ID:	MATRIX	SAMPLE DESCRIPTION	TEST	SUB LAB
P-121-R30NC	23H3258-01	Product/Solid		SW-846 8082A

CASE NARRATIVE SUMMARY

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

SW-846 8082A

Qualifications:

MS-22

Either matrix spike or MS duplicate is outside of control limits, but the other is within limits. RPD between the two MS/MSD results is within method specified criteria.

Analyte & Samples(s) Qualified:

Aroclor-1016

B351009-MSD1

S-01

The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

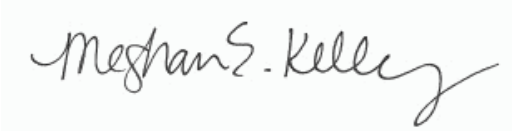
Analyte & Samples(s) Qualified:

Decachlorobiphenyl

23H3258-05[P-125-R31NC], 23H3258-06[P-126-R33E], 23H3258-07[P-127-R33NC], 23H3258-09[P-129-R35W], 23H3258-10[P-130-R37E], 23H3258- 11[P-131-R37S], 23H3258-12[P-132-R31NB]

Decachlorobiphenyl [2C]

23H3258-05[P-125-R31NC], 23H3258-06[P-126-R33E], 23H3258-07[P-127-R33NC], 23H3258-09[P-129-R35W], 23H3258-10[P-130-R37E], 23H3258- 11[P-131-R37S], 23H3258-12[P-132-R31NB]



Tetrachloro-m-xylene

23H3258-05[P-125-R31NC], 23H3258-06[P-126-R33E], 23H3258-07[P-127-R33NC], 23H3258-09[P-129-R35W], 23H3258-10[P-130-R37E], 23H3258- 11[P-131-R37S], 23H3258-12[P-132-R31NB]

Tetrachloro-m-xylene [2C]

23H3258-05[P-125-R31NC], 23H3258-06[P-126-R33E], 23H3258-07[P-127-R33NC], 23H3258-09[P-129-R35W], 23H3258-10[P-130-R37E], 23H3258- 11[P-131-R37S], 23H3258-12[P-132-R31NB]

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.
I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
MS-22	Either matrix spike or MS duplicate is outside of control limits, but the other is within limits. RPD between the two MS/MSD results is within method specified criteria.
S-01	The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

CASE NARRATIVE SUMMARY

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

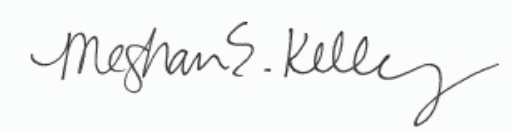
SW-846 8082A

Qualifications:

S-01

The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

Analyte & Samples(s) Qualified:



Decachlorobiphenyl
23H3259-15[P-155-S12F], 23H3259-16[P-156-R10WT], 23H3259-19[P-159-R14WT]

Decachlorobiphenyl [2C]
23H3259-15[P-155-S12F], 23H3259-16[P-156-R10WT], 23H3259-19[P-159-R14WT]

Tetrachloro-m-xylene
23H3259-15[P-155-S12F], 23H3259-16[P-156-R10WT], 23H3259-19[P-159-R14WT]

Tetrachloro-m-xylene [2C]
23H3259-15[P-155-S12F], 23H3259-16[P-156-R10WT], 23H3259-19[P-159-R14WT]

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.
I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
S-01	The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

CASE NARRATIVE SUMMARY

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

SW-846 8082A

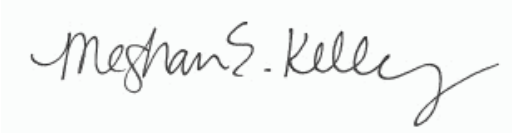
Qualifications:

S-01

The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

Analyte & Samples(s) Qualified:



Decachlorobiphenyl
23H3260-01[P-161-R16SWP], 23H3260-04[P-164-R11WP], 23H3260-05[P-165-R16D], 23H3260-12[P-172-EX], 23H3260-13[P-173-EX], 23H3260-14[P-174-EX]

Decachlorobiphenyl [2C]
23H3260-01[P-161-R16SWP], 23H3260-04[P-164-R11WP], 23H3260-05[P-165-R16D], 23H3260-12[P-172-EX], 23H3260-13[P-173-EX], 23H3260-14[P-174-EX]

Tetrachloro-m-xylene
23H3260-01[P-161-R16SWP], 23H3260-04[P-164-R11WP], 23H3260-05[P-165-R16D], 23H3260-12[P-172-EX], 23H3260-13[P-173-EX], 23H3260-14[P-174-EX]

Tetrachloro-m-xylene [2C]
23H3260-01[P-161-R16SWP], 23H3260-04[P-164-R11WP], 23H3260-05[P-165-R16D], 23H3260-12[P-172-EX], 23H3260-13[P-173-EX], 23H3260-14[P-174-EX]

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.
I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

Meghan E. Kelley
